Delineation by Instrumental Contouring—A very precise knowledge of the configuration of surface may be acquired by carrying true contour lines over the ground and projecting them on the map of the survey. But the contours do not give a true representation of the ground, for they seldom represent actual lines on the surface, as do the lines on the map which indicate roads, watercourses, walls, enclosures, &c., they give, however, a conventional representation which is sufficient *per se* for the engineer and the expert, and they furnish guiding lines for all shading, whether by hachures or mezzotint, which may be subsequently executed to produce an artistic delineation of the features of the ground. In instrumental contouring we have first to decide on the vertical intervals to be maintained between the contours. They depend on the scale of the survey and the nature of the ground. In the Ordnance Survey they are made as small as from 5 to 10 feet, when special plans on large scales are being prepared for engineering requirements, but for the general maps they are 50 feet up to an elevation of 100 feet above the sea level, and 100 beyond up to 900 feet, which elevation, being the practical limit of cultivation, is the highest generally marked, though in the northern counties of England and in parts of Scotland additional contours have been executed at the altitudes of 1000, 1250, 1500, 1750, 2000, 2500, 3000, &c., feet. The intervals having been determined on, instrumental levelling is commenced at either the top or the bottom of those slopes which best define the general lay of the ground, or at some previously established bench mark of which the height above the sea is known. Points are marked out on the slopes with pickets at the prescribed vertical intervals, and then the contour lines of the horizontal planes passing in succession through each of these points are traced with a levelling instrument and staff and surveyed by traverse, the two processes being performed either simultaneously or consecutively as may be most convenient.

The instruments generally used in the Ordnance Survey are a 6 inch theodolite—employed as a levelling instrument—and a contouring staff, 8 feet long, provided with a sliding vane which may be fixed at any required height, the staff is shifted about until the vane is brought into the horizontal plane of the theodolite, when the bottom of the staff will be on the contour line. A serviceable contouring instrument of very simple construction is the water level, which consists of a pan of transparent phials partially filled with water, the phials are placed upside down at the ends of a hollow bar fixed on a rotatory vertical axis, and have their mouths connected with piping of any available material,—brass, tin, or gutta serena. The water in both phials is in free communication, and the water surfaces indicate the horizontal plane naturally, without any mechanical contrivance. The instrument is well suited for short sights not requiring a telescope, and may be readily manipulated by persons ignorant of the use of instruments of a higher class. Eye reflecting levels, clinometers, orometers, and other light instruments, which may be held in the hand and do not require a fixed support, are frequently employed for interpolating minor between major contours. In military sketching on large scales, hypothetical inclinations and lengths are sometimes measured, the bases and perpendiculars are deduced on the spot from a table

¹ With certain exceptions, principally of a military nature, the hill features are now sketched on the 1 inch scale, on photographic reductions of the 6 inch contoured sheets, faintly printed in orange colour, as a guide to the sketchers.

of gradients, and then the contour lines, and the orthogonals also if required, are laid down

VI. GEOGRAPHICAL RECONNAISSANCE.

Geo-
graphical
reconnais-
sance.

When a traveller passes through an unknown or little known region the opportunity afforded him of acquiring some new geographical knowledge depends largely on the configuration and aspects of the ground, the condition of the atmosphere, the attitude of the inhabitants, and the time available. If hills are numerous and prominent and free from forest, and other conditions are favourable, a large area may be covered in a short time by reconnaissance from the stations of a chain of triangles carried along the line of route, fixing points in advance, some of which become stations of observation whence further points are fixed, and thus the continuity of the operations is maintained. But the ground may be flat and devoid of prominent points, the view circumscribed by forests and other obstacles, the atmosphere dense and unfavourable for distant vision, the inhabitants hostile, and the time short, and the traveller may be restricted to his line of route and unable to deviate from it, he must then endeavour to maintain a continuous traverse of the route, sketching in the ground in its immediate vicinity. Whenever breaks of continuity occur he must resort to astronomical observations to effect a connexion between the dissociated sections of his survey and to obtain an independent check on the general accuracy of the operations. He has therefore to be prepared to measure base-lines, to carry on a triangulation in some regions and a traverse in others, and to make any astronomical observations which may be wanted, and, if possible, to complete his mapping on the ground instead of postponing it to be done elsewhere. He should supply himself with some instruments suited for rough and rapid work and with others for better work when time and opportunity permit, and he should be careful to arrange beforehand the general character of the proposed operations and the scales and projections to be adopted for the mapping, he should also provide himself with blank sheets of paper duly gratulated to scale, for work in detail in the vicinity of the line of route and for general geography. For measures of base lines and distances on the ground, chains, rolls of crinoline wire, long Assam canes, and perambulators may be employed, also odometers and subtense theodolites, to measure the angle subtended by a pole of known length, whence the distance may be deduced. For measures of angles and bearings, either theodolites,¹ or sextants, or prismatic compasses may be used, according as more or less accuracy is required. For the general survey the plane table is a most valuable instrument. It enables bearings to be at once laid down on the paper without previous measurement, and much detail to be sketched in on the spot, instead of being plotted subsequently from a field-book, then the only independent angular measurements which need be taken are those of the principal triangles and of very distant points beyond the range of the table. Rough and rapid route surveys may be made by pacing the distances, taking the magnetic bearings, and combining with the results of astronomical observation. Many thousand

miles of itinerary through regions in Central Asia have been surveyed by Asiatic employes of the Indian Government in this way, the northings and southings were controlled by latitude observations, and the factors thus obtained were applied to the eastings and westings, longitudes being impracticable. The theodolite should be employed to fix points on very distant ranges, for it will give good results, even with short bases and very acute angles, provided the objects actually observed are well identified in each instance. Observations should be taken from three stations, giving two triangles with a common side, which will at once show up any mistake, whether of identity, circle reading, or calculation. Whenever a break of continuity occurs in the triangulation or the traversing, astronomical observations must be resorted to. Much may be done by a judicious introduction of latitudes and azimuths, more particularly where there is considerable northing and southing, for then differences of longitude may be obtained from the azimuths and differences of latitude. A prominent peak, visible from great distances all round, may be made to serve as a connecting link between regions which cannot be continuously connected, by measuring its azimuth and distances from a base line in each region, the addition of latitudes at the azimuth stations will much strengthen the work.

Collateral Astronomical Determinations—Determinations of azimuth, latitude, time, and longitude may all be required for geographical reconnaissance,—the first two more particularly, as they can be obtained readily with much accuracy, the fourth, being much the most troublesome to get and the least reliable when got, is only resorted to when it cannot be dispensed with.

The azimuth of an object may be determined without azimuth calculation by observing the angles between the object and a star at equal altitudes on opposite sides of the meridian, but it is generally found by observing the angle in one position of the star and applying thereto the azimuth of the star as obtained by calculation. In the spherical triangle PZS , in which P represents the pole, Z the zenith, and S the star, the angle PZS is the star's azimuth, which can be computed when any three parts of the triangle are given. PS , the polar distance of the star, is given by the tables, and PZ , the co-latitude, must be previously determined; then, for the third part, we may have either (1) PSZ , a right angle, by observing a circumpolar star at its maximum elongation, or (2) the hour angle P for any star, by taking the time of the observation, or (3) the zenith distance ZS , by measurement simultaneously with the horizontal angle. Of these three methods the first is the most accurate, but it is not always convenient, the second requires, in addition, special observations for time, the third is generally the most convenient, for it may be performed between sunset and dark, when the stars are coming into view, but when there is still sufficient light to illuminate the wires of the telescope and the referring mark, and thus enable lamps to be dispensed with.

Fig 7

The latitude is most readily determined by measures of stars' zenith distances on the meridian, duly corrected for refraction, then, the polar distance being known, the latitude is at once ascertained. The stars should be observed in pairs of nearly equal zenith distance, north and south, for this eliminates all constant instrumental errors, as of index, eccentricity, and graduation, and also errors in the adopted refractions. When a single star is employed, circummeridian observations of zenith distance may be taken and reduced to the meridian by calculation, tables for the pole star are given in the *Nautical Almanac*, which enable an observation, taken at any known time in the 24 hours, to be reduced to the pole.

¹ In many respects a theodolite is more suitable than a sextant. (1) it measures horizontal angles directly, whereas the sextant measures oblique angles, which have to be reduced to the horizon, (2) it measures a range of several angles with much greater facility, (3) it measures all vertical angles with equal facility, including the small elevations and depressions of distant peaks which cannot be readily seen by reflexion from mercury for measurement with a sextant, (4) its telescopic power is usually far higher, (5) it may be so manipulated as to eliminate the effects, without ascertaining the magnitudes, of the constant instrumental errors,—eccentricity, index, and collimation, and (6) when much accuracy is required the influence of graduation errors may be greatly reduced by systematic changes of the settings of the horizontal circle.

Time

The time is usually best determined by measuring the zenith distances of stars situated not far from the prime vertical, then, the latitude and polar distance being known, the hour angle P of the spherical triangle is found by calculation. Time may also be determined by observing the transits of stars over the wires of the telescope of a theodolite set up in the meridian.

Longitude

The longitude may be determined either absolutely, by purely astronomical methods, as by observations of the moon's motion, or differentially, with the aid of telegraph lines and travelling chronometers. Absolute longitude is the geographer's great difficulty, for much time must be devoted to the observations, and much more to their reduction, when undertaken with the object of fixing the relative positions of the stations of a survey. The observations are of various kinds,—(1) lunar distances, *i.e.*, the distance between the moon and the sun or one of the stars given for this purpose in the *Nautical Almanac*, (2) lunar zenith distances, observed at points of the moon's path where the conditions are favourable, (3) lunar transits over the meridian, observed with transits of the moon-culminating stars given in the *Nautical Almanac*, (4) lunar occultations of stars, (5) eclipses of the sun and moon, (6) eclipses of Jupiter's satellites. The first method requires the employment of a sextant or other reflecting instrument, the second may be accomplished with either a reflecting instrument or a theodolite, the third with a theodolite, for the last three a good astronomical telescope is wanted. The first, when carried out strictly, requires three observers,—one to measure the lunar distance, while the others are measuring the zenith distances of the moon and the star, but, as the last two are not wanted with great accuracy, the several observations may be taken in succession by one person, and the observed zenith distances afterwards adjusted to the time of the lunar distance.

The effects of errors of observation in these methods are as follows. In (1) an error in time produces the same error in the longitude, and an error of one second of arc in the distance produces two seconds in time in the longitude. In (2) an error of one second in time produces at least thirty seconds of time error in the longitude, and one second of arc in the zenith distance at least two seconds of time in the longitude. In (3) to (6) an error of time produces the same error in the longitude. The first method is preferred by seamen and travellers, who are more expert in the use of the sextant than of the theodolite. The second method is preferred by those who are more familiar with the theodolite, and who are equipped with one of good telescope power. It gives very good results when the observations are made at the most favourable time, which occurs when the resultant of the moon's motion in right ascension and in declination lies in the direction of the observer's zenith, this time may be readily found by graphical projection on a chart of the heavens.

Differential longitude

Differential longitude may be determined chronometrically, on land as at sea, by carrying about several well-rated chronometers and comparing their times with the local times deduced from observations of the sun and stars, or electro telegraphically, by interchanging signals between two stations connected by a telegraph wire, and ascertaining the local times at which the signals are transmitted from and received at each station.

Hypsometry

Hypsometry.—Determinations of height form a very necessary part of geographical reconnaissance. Whenever triangulation is possible, vertical angles may be measured and the heights ascertained in regular succession. But in a traverse this is scarcely practicable, breaks of continuity in the verticals are liable to be of frequent occurrence, and then recourse must be had to observations of the pressure and temperature of the atmosphere, or of the temperature of the vapour of boiling water, from either of which fairly correct heights may be deduced differentially under normal atmospheric conditions in settled weather. The instruments employed for this purpose are mercurial and aneroid baro-

meters and boiling-point thermometers, descriptions of them, and the formulæ employed in reducing the observations, are given under *BAROMETRY* (vol. III pp 381-387). Here it is only necessary to add that the date and hour of every barometric observation should be recorded, and the observations referred for reduction to those taken at the same time at one or more of the nearest standard meteorological observatories, otherwise corrections should be given to the barometer readings for the hour of the day and the month of the year, in order to reduce them as nearly as may be to the local mean altitude of the mercury. The index errors of aneroid barometers, being liable to variations, should be determined from time to time by observations at stations of known altitude, or by comparisons with boiling-point thermometers.

VII NAUTICAL SURVEYING

Nautical surveying has for its object the determination of the configuration of land which is covered and concealed from view by water, more particularly along the fore-shore of a coast-line, and wherever navigation is carried on in comparatively shallow waters and a knowledge of the depth of water is of great importance, it has likewise to lay down the positions of oceanic islands, shoals, and rocks, and generally to delineate whatever land exists immediately above or below the surface of the ocean. Its methods differ according as they are performed in or out of sight of land. When in the vicinity of land it is preceded by a survey of the coast-line and a belt of the country beyond, which must be of sufficient breadth to furnish suitable points of reference for the survey operations on the water, and may have to be extended inland to embrace those peaks of distant hill ranges which are prominent objects at sea for the guidance of mariners. Thus done, the nautical survey is carried on in boats, by taking soundings and determining the positions of the boats by observations to some of the points already fixed on land. The observations are necessarily made with sextants and magnetic compasses only. With the former the angles between conspicuous land marks are measured, and, as the angle between any two points is half the magnitude of the angle between the same points at the centre of the circle which passes through them and through the boat, the measurement of two angles between three points enables two circles to be drawn on the chart, the intersection of which will generally indicate the position of the boat with sufficient accuracy. Occasionally, however, it happens that the positions of all three points on shore and the boat also lie actually, or very nearly, on the circumference of one and the same circle, then a bearing taken with the compass will fix the position of the boat on the circumference of the circle. Time is noted whenever soundings are taken, that due allowance may be made for the rise and fall of the tide. All the sounding stations are not fixed by observations to points on shore, as just indicated but only a certain proportion, and between them straight lines of sounding are run, with intervals measured either by a patent log, or by time, or by counting the strokes of the oars, whenever possible the lines of sounding are carried parallel to each other. Sounding is the most important part of a nautical surveyor's duty and that on which his character mainly depends. It is essentially the work of the sailor, for in carrying it out the accidents of wind and water—the direction and force of the wind, the rise and fall of the tide, and the velocity of currents—must be duly taken cognizance of and the work managed to suit wind and weather, on the other hand, the work on land is done by land-men. Nautical surveying out of sight of land, rests on astronomical determinations of latitude and time, chronometric longitudes, and dead reckoning.

When triangulation is resorted to, base lines are measured sometimes with a patent log, sometimes by sound, by noting the interval in time between the flash and the report of a gun. The great length of modern ironclads presents a base line which is occasionally very convenient. Points are taken at each end of the ship, as far apart as possible, from which two observers can see each other, they are carefully marked, and the distances between them determined for future reference, then angles between moderately distant objects and observers standing at these points, taken simultaneously from each point, enable the required distances to be obtained. The magnetic variation is determined by observing the azimuth of the sun, when on or near the horizon, with a standard compass fixed amidship, care being taken beforehand to determine any deviation of the needle which may be due to the attraction of the surrounding ironwork, by observing the bearing of a distant mark as the ship is swung round and her head laid on different points of the compass. See also NAVIGATION (Practical), vol. VII p. 264.

VIII MAPPING

Graticulation

Graticulation—The sheets of paper on which the details of the survey of any large area of country are to be laid down must be furnished with a system of conventional lines, drawn with a view to assimilate the margins of contiguous sheets and to form a graticulation within which the details may be accurately inserted. The graticule is sometimes rectangular, sometimes spherical, sometimes a combination of both, as when points of which the latitude and longitude coordinates are given have to be plotted within rectangular marginal lines. Spherical graticules are constructed in various ways, usually in accordance with some specific method of projection, see GEOGRAPHY (Mathematical), vol. X. p. 197. The following convenient method is not referable to any demonstrated projection, but is generally employed on the Indian Survey. Suppose the intersection of two meridians by two parallels to form a small spherical quadrilateral, with sides of aliquot parts of a degree in latitude and in longitude, let m be the length of each of the meridional arcs, p, p' the lengths of the arcs on the upper and lower parallels, and let q be a diameter, then

$$q = \sqrt{m^2 + p'p},$$

thus, m, p , and p' being given, q is calculated. With these data, which are tabulated for different arcs and scales, the corner points of a number of quadrilaterals are laid off in succession on either side of an adopted meridian, and lines are drawn through the points to indicate the collateral meridians and the parallels of latitude. The latter are always curved, more or less sensibly, the former are also curved, though in a much less degree, being concave to their initial meridian, and the more so the farther they are from it. When the area is small and the scale large, the meridians are practically straight lines, and the several sheets of a map, each projected on its own meridian, will fit together closely when carried on in any direction. But, when the area is large—exceeding 8 or 10 square degrees—and the scale small, the sheets will not fit together continuously unless they are projected with reference to a single meridian for the whole map, to which the meridians on either side will be increasingly concave, or unless all the meridians are made straight lines, by slightly contracting each of the intermediate arcs of parallel to a length which is exactly proportioned to the lengths and relative distances of the upper and lower parallels of the map from it. There must be some distortion in either case. In the first, meridians which are actually straight lines are represented as being curved, in the second, straight meridians are obtained, but the distances between them are exact

only on the upper and lower parallels, and are too small elsewhere, more particularly on the middle parallel, the length of which necessarily exceeds the mean length of the upper and lower parallels.¹ But distortion is inevitable whenever a spherical surface is projected on a plane.

When a map is constructed in rectangular sheets, some station is adopted as the origin and its meridian as the principal axis, to which the corner points of the sheets are to be referred, the coordinates of these points are given such dimensions as are most suitable for the size and scale of the map, and are equivalent to the rectangular spherical coordinates of imaginary points on the curved surface of the earth, at corresponding distances from the origin and its meridian. These being given, the distances of the points from the origin in latitude and longitude may be computed, as already shown (p. 706), thus data become available for projecting the graticulation of meridians and parallels within the rectangular marginal lines of each sheet, or for introducing the divisions of latitude and longitude on the marginal lines if preferred. Conversely, when the latitudes and longitudes are given, the rectangular spherical coordinates are computed and the marginal lines projected around the graticulation. Filling in is then commenced: the principal stations are laid down by their coordinates and the topographical details pencilled around them by copying or tracing the field sheets of the survey, the names and the outlines are then inked in, the shading for delineating the features and general configuration of the ground is usually done last of all. The manner in which the details are inked in and rendered permanent depends on whether the map is to be reproduced by hand only—as when it is to be engraved or lithographed—or whether in its reproduction photography is to be employed and the action of light invoked, either in entire supersession of or in partial co-operation with the labour of the draftsman. In the former case the map is made as perfect a pictorial representation of the surface of the ground as possible, the hill features being represented artistically in mezzotint shading with a brush or in chalk drawing, and a variety of colours used to facilitate discrimination of differences of topographical detail. In the latter no colours are used which will not photograph well, nor flat shades of any colour, nor—as a rule—mezzotint shading, but only some substitute therefor in pen and ink. This last condition is essential for the commonly employed processes of photo-zincography and photo-lithography, but endeavours have recently been made, with some degree of success, to reproduce mapping in middle tones by the processes of photocolotype and photo-gravure.

Photography is much employed as an auxiliary in map-making, for when a map is to be published on various scales the hand-drawn details of the largest scale edition may be reduced by its means as accurately as by the familiar pantagraph, and of course very much more rapidly. Thus in the Ordnance Survey town maps on the scale of $\frac{1}{2500}$ are reduced to the scale of $\frac{1}{10000}$ for incorporation into the parish maps, the latter are reduced for insertion in the 6-inch maps, and they in turn for the 1-inch map. By limiting the dimensions of each sheet for reduction to 3 feet by 2, and by a judicious use of stops to lenses, the reductions are made without any error in scale or any distortion that can be detected by the most rigid examination. But photography reduces every part of the original alike, the printing of words and names as well as the topographical details, and it reproduces all the minor and less important

¹ In Mr O Farrell's pamphlet *On the Construction and Use of the Six Sheets of Marginal Lines for Maps of every part of the World*, published by the Ordnance Survey, tables are given of the lengths of meridional and longitudinal arcs, their versines and diagonals, for every ten minutes in latitude from the equator to 80° N and 80° S.

and as well as the more important features, hence a reduction is rarely suited for reproduction without intermediate modification, the printing being generally too small to be easily legible, and the mass of minor detail tending to confuse the principal sublines. The draftsman is therefore called in and the procedure so arranged as to obtain the best results with the least labour. Either he may construct a new map by tracing from a silver print of the photograph whatever topographical details are required for it and omitting the rest, or he may ink in such details at once with black ink on a blue print taken from a transfer of the photograph to stone or zinc, in both cases adding names and writing of appropriate sizes, either result may be reproduced by photography, as the unblackened details of the blue print will disappear in the process. This done, a transfer to stone or zinc may be made from the second photograph for the printing off. Prints from photographic reproductions to full scale exhibit all the blemishes of the hand drawing and somewhat exaggerate them, whereas prints from photo reductions are free from blemish, and often as clear and sharp as good hand lithographs. In employing a process of double photography, therefore, the first photo is usually made on a larger scale than that for publication, the lines of the printing and topographical detail are correspondingly exaggerated by the draftsman, and then the second photo is a reduction, which should be sharp, clear, and free from blemish.

IX. MAP PRINTING

Various processes are employed for the reproduction of maps in large numbers for general issue, some are purely manual, the map being redrawn by hand on copper, stone, or other substance presenting a suitable surface from which prints may be taken, or on paper specially prepared for transfer to such substance, others are carried out with the aid of photography, whereby an exact copy of the original can be obtained either directly upon, or for subsequent transfer to, the surface to be printed from. The former include the processes of copper plate engraving and lithography, which are the oldest and still in some respects the best of all, but slow and expensive, the latter include the processes of photo-lithography, photo zincography, photo gravure, and photo collotype. Engraving on stone is much employed on the Continent for map work, being cheaper and quicker than engraving on copper. Electro-metallurgical processes are frequently employed in connexion with copper plate engraving, either to protect and harden the surface of the plate with a facing of steel or to furnish duplicates to be printed from, instead of the plate itself being used, sometimes the wear of the plate is prevented by transferring a print from it to a lithographic stone or a zinc plate, from which the printing is done in its stead. By the anastatic process an old print of a map may be transferred to a zinc plate to be printed from.

Engraving

Engraving may be performed on copper, wood, zinc, or stone, see vol viii p 435. As done on copper plate for mapping, it is a combination of ploughing with the burin and etching with an acid, the former being used for the names and topographical outlines, the latter for the features of the ground. The system adopted in the Ordnance Survey of Great Britain—where it has been largely employed and carried to great perfection—is as follows. The 6 inch maps of the survey are engraved on copper plates measuring 36 by 24 inches within the marginal lines and weighing about 35 lb, the 1 inch maps are 18 by 12 for England and 24 by 18 for Scotland. The corners of the maps, the prescribed marginal subdivisions, and the trigonometrical points are first marked on the plate by a scoring machine, in which it is laid, and which is provided with a travelling carriage holding a steel pricker. The carriage is moved along a graduated scale and the pricker along another scale at right angles to the former, and all points of which the rectangular coordinates are known are laid off by vernier read measurements from the two scales. The plate is then removed from the scoring machine, heated, and given a thin coating of white wax, to form a surface on which the topographical details are plotted before the graving is commenced. This surface is divided into a number of rectangles by fine lines joining marginal subdivisions, the distances between which are usually so regulated as to introduce sixteen of the survey sheets on the 2500 scale into one sheet on the 6 inch scale. The reductions to this scale are made by photography, and the subsequent reductions to the 1 inch scale either by the pantagraph or by photography. Tracings of the reductions in lamp black, made to fit into the rect angles, are transferred to the wax ground by rubbing with a steel burnisher. The plate is then ready to be placed in the hands of the

engravers, who complete first the outlines, then the printing and writing, and afterwards the ornament, each class of work being usually done by a different person. The figures of latitudes, longitudes, and altitudes, and various conventional symbols, are stamped with steel punches. Parks and sands are ruled with a dotting wheel, and buildings shaded in lines with a ruling machine. When a plate of the 1 inch map is being engraved, all the printing is completed, and line engraving with the exception of the contour lines, and then an electrotype duplicate of the plate is taken. The contour lines are engraved on the duplicate, and the hills are etched on the original plate, thus two editions of the map are obtained, one with contours but without hills, the other with hills but without contours, the topographical details and writing being the same in both. In etching, the surface of the plate is thinly coated with an acid resisting substance composed of asphalt, Burgundy pitch, and virgin wax, forming an etching ground, on which the outlines of the hill features are traced, and then marked through with a needle which removes the ground where it passes, exposing the surface of the copper. Aqua-fortis is applied to bite in the finer lines and then poured off, the parts which are bitten sufficiently are painted over with "stop-ping varnish", and acid is again applied. The processes of stopping out and biting in are alternately repeated until all the required tints from the lightest to the darkest are produced. In printing from a copper plate, a much more powerful press has to be used than in printing from stone or zinc, as the ink lies in the furrows that have been ploughed or bitten into the plate and not on its surface, the process of printing is also much slower. In engraving on stone or zinc, the surface is coated with a preparation of gum and lamp black, and on it the detail is traced with red chalk and afterwards cut in with very fine steel or diamond points so as just to lay bare the surface of the ground without penetrating to any depth, as in copper-plate engraving. A little oil having been rubbed over the surface, the gummy composition is washed away and printing ink applied, the printing is performed almost exactly in the same way as in ordinary lithography, except that the printing ink is in the first instance spread over the stone or the zinc plate with a dabber instead of a roller.

Electrotyping is employed to conserve work engraved on copper, either by depositing a thin surface of steel over an engraved plate, typing which enables it to be printed from very much oftener without injury, or by producing a duplicate to be employed in its stead in the printing. In the latter case, a double process is gone through first, a cast or matrix is produced in relief by the deposition of copper on the surface of the original plate, and then an intaglio of the matrix—which is therefore a duplicate of the original—is formed by depositing copper on the surface of the matrix. For details of these processes, see *Electro-Metallurgy*, vol viii p 114. In the Ordnance Survey electrotyping was first employed to obtain duplicates on which to make the corrections and additional necessary to show the growth of railroads and towns since the time of the original survey. The alterations are effected more easily when obsolete details are scraped off the electrotype matrix than when they are scooped out of an intaglio, the original plate is also preserved intact. Electrotyping is further serviceable in producing the two editions of the general map, one with contour lines, the other with hill shading, already mentioned, as well as editions for geological and other details. It is also serviceable in effecting a combination of portions of several plates: matrices of the different portions are mated together to form a single plate, then an intaglio of this plate is taken, on which any details lost at the junction of the matrices are made good by hand. The dimensions of a full sized plate are 38½ by 26½ inches, the weight of a matrix is 18 lb, and of the duplicate 38 lb.

There are two essentially distinct processes of lithography,—one Litho in which the map is wholly drawn by hand on the stone, the other, graphy a much quicker but coarser process, in which it is traced with greasy ink on specially prepared paper, which is then laid face downwards on the stone. When lithographs are to be produced by a single printing, all hill features, as well as topographical outlines and names, are drawn with a pen or fine camel hair brush in ink of one colour. Double printing is necessary when the hills are drawn in chalk, two stones being required, one for the chalk work, the other for the pen and ink work, and in chromo lithography a separate stone is required for the work in each colour. For full details, see *Litho-graphy*, vol viii p 699.

Zincography has of late years largely taken the place of litho-graphy for printing from hand drawn transfers, though not for graphy hand drawing on the surface of the zinc, as on stone and copper. Zinc plates are less costly and bulky than lithographic stones, and are much more conveniently handled. Thus a plate measuring about 43 by 28½ inches and ⅝ of an inch thick weighs 60 lb, is easily carried by one man, and costs 16 shillings, a lithographic stone of the same surface is 4½ inches thick, weighs 450 lb, requires four men

¹ In the French and Austrian surveys corrections are made on fresh copper deposited by electricity over the faulty parts, which are scooped out.

ink. When a map is photographed in several sections, as often happens, each section overlaps well all round to enable the transfers from the different negatives to be neatly joined together without showing lines of junction, if the whole is too large to be printed on a single sheet of paper, it is cut up into sections for printing separately.

Photo
typo-
graphy

The object of photo typography is to obtain by photographic agency a surface block which may be set up with type and printed in the same way as a woodcut. The image may be obtained on a zinc plate by transfer in the same way as for photo zincography, or it may be printed directly from a reversed negative. In the latter case the zinc plate is usually prepared with a thin coating of bitumen, a substance which has the property of becoming insoluble under the influence of light, so that, when after exposure the plate is washed with turpentine or benzole, the image remains on the zinc, while the ground is washed away. In both cases the image is strengthened by careful inking and by the application of powdered resin, which the plate is heated sufficiently to melt. The image is then etched with nitric acid. The operations of inking, applying resin, and biting with acid are repeated several times, until the plate is bitten sufficiently deeply to give clear prints. In another process, which is perhaps preferable for fine work, a mould is obtained by electrotyping a relief in swollen gelatin, the surface of which has been metallized with plumbago or bronze powder. These processes are largely used for producing small maps to illustrate books and newspapers, but not for maps of ordinary size.

The three mechanical processes just noticed are only applicable to maps drawn in line, and to get good prints every line should be of the same blackness, though of different breadth. Attempts have been made to reproduce brush shaded drawings, exhibiting continuous gradations of shade, by photo lithography and photo zincography, but with very partial success, and only by breaking up and destroying the continuity of gradation. The following processes are specially suited for reproducing maps in half tone.

Photo
collo-
type

In photo-collotype, so-called from the printing surface being of gelatin, a plate with a perfectly smooth surface, usually of thick glass, either is coated with a sensitive mixture of gelatin and bichromate of potash, upon which the photographic image is produced by the action of light through a reversed negative, or is employed to support a gelatin film on which the image has been imprinted from an ordinary negative, and which is attached to the plate with suitable cement. The gelatin when properly moistened possesses the valuable property of receiving a greater or less amount of ink in different parts of the image in exact proportion to the intensity of the action of the light on each part, thus it is capable of reproducing the most delicate gradations of shade. The process is admirable for maps of small size, which only require a single plate, but is not suited for making a combination of sections to form a map of ordinary size, nor can additions or corrections be made on the gelatin film, which is, moreover, so tender that it does not readily permit of a large number of prints of uniform quality being taken, and is easily damaged.

Photo
gravure.

The several methods of obtaining an incised image on a copper plate by means of photography are broadly divisible into the two groups of electrotyping and etching processes, one of each will be briefly noticed. (1) A positive pigment print, forming a relief in hardened gelatin, is developed on a silvered copper plate by the ordinary operations of the autotype or pigment printing process, it is then black-leaded and copper is deposited on it to form an electrotype intaglio, from which prints may be taken in the usual way, three to four weeks being required for the deposition of enough copper to produce a plate of sufficient thickness. (2) A negative pigment print is developed on a highly polished copper plate, upon which a very fine grain of powdered resin has been deposited and fixed by heat. The intaglio is obtained directly on the plate by biting in with a solution of perchloride of iron, which penetrates the gelatin film with comparative ease in those parts representing the shades and lines of a map, where there is little or no gelatin, and thus bites the copper to a considerable depth, while in the parts representing the blank spaces and ground of the map, where the gelatin is thicker, it penetrates with more and more difficulty as the thickness of the gelatin increases, and in the highest blanks should leave the copper untouched. The operation of biting takes only a few minutes, and the gravure is remarkable for its delicacy of gradation and richness of effect, there is, however, some difficulty in etching to the proper depth so that the plate may stand much printing without the loss of the finest tint. In both cases the copper plates have to be protected by a facing of steel before they can be printed from. The processes have not yet been used to any great extent for maps with half tones, but they are very promising. For maps in line the first method gives excellent results, and is largely employed in the Austrian and Italian surveys.

X INSTRUMENTS

The instruments employed in survey operations are broadly divisible into two classes, one for making the

requisite linear and angular measurements on the ground, the other for plotting the data thus acquired on paper, and for measuring from the map, when completed, lengths and areas which it may not be convenient to calculate from the numerical data. As a rule different instruments are employed for the mensuration on the ground and for the plotting on paper, but to this rule there is a notable exception in the plane table, by means of which all bearings may be drawn directly on paper with a sight rule, without previous measurement of any kind, and thus a plot of the ground may be constructed without employing any other instrument.

Field Instruments.—These are of two classes,—linear, for determining distances directly by actual measurement along the surface of the ground, and angular, for determining the bearings of, or the angles between, any objects. Some instruments are automatic, as the needle, which points to the magnetic north, the plumb line and the spirit level, which indicate the direction of gravity, and hypsometers of various kinds, for measuring altitudes, others are entirely controlled by the manipulator. Some require to be rigidly supported on the ground, as measuring bars and theodolites, others are adapted for flexible supports, as reflecting and magnetic instruments, which may be employed either on land or on the oscillating deck of a ship at sea. Some, as magnetic compasses, measure angles in the horizontal plane only, others, as theodolites, in two planes,—one horizontal, the other vertical, others, as reflecting instruments, in all planes, others, as levelling instruments, measure nothing, but simply indicate a plane of reference. And there are certain instruments by which angles are measured in the ordinary way, and direct distances are determined by micrometric measures of the small angles subtended at a distance by objects of known dimensions.

Linear instruments are of two classes,—one for exact measurement of base lines the lengths of which are required to be known with great precision, the other for ordinary and rough measurement of distances. Among the former may be included the Colby apparatus of compensation bars and microscopes, described in sect I, § 2 (p. 696 above), Bessel's apparatus, those of Struve and the United States Coast Survey, and Porro's (adopted by the Spaniards and the French in Algiers), which have already been described in *FIELD INSTRUMENTS*, vol. vi pp. 598, 600, and *GEODESY*, vol. i pp. 163, 164. For less exact but still essentially accurate measures the instruments most commonly employed are the brass or steel chain of 100 links, the graduated metallic tape, and the offset pole.

For reconnaissance and rough measurement, perambulators, with wheels of known periphery and dials to indicate the number of revolutions, are largely used in India. Crinoline wire has been employed with advantage in Australia, it is so light that a length of 1000 feet or more may be easily carried, rolled on a drum, by one man, who pays it out as wanted, he is usually followed by another, who commences rolling it up at the opposite end when an entire length has been laid out on the ground. Air lines are sometimes measured by stretching the wire over the tops of trees in valleys obstructed with forest, also the breadths of rivers by resting the wire on logs anchored at suitable intervals to support it above water.

Angle measuring instruments are of two classes, direct and reflecting. Both are provided with an aligher, usually a telescope, which is pivoted over the centre of the graduated circle or sector. In one the aligher is pointed in succession to any two objects the horizontal angle between which is being measured, in the other it is pointed merely to one object, while an image of the second is thrown on the first by double reflexion from a pair of mirrors. Reflecting instruments are largely employed in nautical surveys, as they can be held by the hand and do not require a rigid support, but they are very rarely used in land surveys. A description of them will be found under *SEXTANT* (vol. vii pp. 724-725). They give the angle in the plane in which they are held, and, whenever this plane is sensibly oblique to the horizon, the angle must be reduced by calculation to the plane of the horizon before it can be employed in the work of a land survey. The other instruments give the required horizontal angle, whatever the altitudes of the objects observed.

The circles of angle measuring instruments are usually divided into 360 equal parts called degrees, and subdivided into spaces ranging downwards from thirty to five minutes of an arc, as the diameter of the circle is increased. Smaller angles are measured by interpolation between the subdivisions, with the aid of a circle reader which moves with the aligher. All instruments except those of the simplest form are supplied with one or more circle readers and spirit levels and a telescope, the construction of which, which are common to so many instruments, will not be further described, and afterwards the more important instruments which are employed in connexion with survey operations.

Circle readers are of two kinds,—the vernier and the micrometer.

Circle
reader

Both are held over the circle at the extremity of a radial arm pivoted over its centre. The vernier moves in contact with the surface of the circle, while the microscope views it a short distance off, the former is usually applied to circles whose diameters do not exceed 12 inches, the latter to those of larger diameter. Both kinds of reader are applicable to linear scales as well as to graduated circles, the microscope being usually employed when most precision is desired.

Vernier

The vernier is so called after its inventor, a Frenchman. Its principle is very simple. The space between any convenient number, n , of graduations on the circle is set off on the vernier and divided into $n+1$ equal parts, then some one division of the vernier will always coincide with a graduation of the circle. On counting the divisions from the index onwards it is found that the coinciding division, say the m th, of the vernier is opposite the m th graduation of the circle, counting from the last one passed by the index. This indicates that the distance of the index from the last graduation is $\frac{n}{n+1}$ parts of the space between the graduations, n is invariably taken as an odd number, such that the unit of $(n+1)$ may be some convenient aliquot part of the circle, as a minute for a circle divided into degree spaces.

Micro
meter
micro-
scope

The micrometer microscope presents the combination of object and eye glasses met with in ordinary microscopes, with the addition of a wire-carrying diaphragm, movable by a screw, for micrometric measurements in the plane of the focus of the object-glass. The tube is conical at the object end and cylindrical at the eye end, the box of the micrometer is mounted between these two parts at right angles with the visual axis. The tube is held at the extremity of the arm of an alidade, in a collar in which it may be moved closer to or away from the surface of the circle, or be turned round so as to place the micrometer tangentially to the circle. The distance between the micrometer and the object glass is usually about four times that between the object glass and the face of the circle, and thus a correspondingly magnified image of the space between the graduations is obtained in the plane of measurement. The object glass is held in a small tube which can be screwed in or out of the principal tube, to enable the length of the image to be adjusted to an exact integral number of revolutions of the micrometer. The box of the micrometer and the wire diaphragm are rectangular, the latter sliding to the right or left within the former. Slow motion is communicated to the diaphragm by the micrometer screw, which passes into it through a collar on one side of the box, against which the shoulder of the screw is pressed by an internal spiral spring acting against the sides of the diaphragm and the box. The screw is furnished with a circular head divided into a number of equal parts—usually 60, each equivalent to 1" for circular arcs, and 100 for linear scales—and is rotated opposite an index arm fixed on the box, complete revolutions are marked by the teeth of a stationary comb, which is fixed above the wire of the diaphragm and viewed with it through the eye piece.

Spiral
level.

The spiral level consists of a glass tube not quite filled with alcohol, a small quantity of air being left, which rises as a bubble to the highest part of the tube. In small and coarse levels the diameter of the tube is largest in the middle and decreases uniformly towards the ends, which are closed by the blow pipe, in long and delicate levels the tube is cylindrical, but with a longitudinal portion of the interior surface ground to the curvature of a circle of greater or less radius according as the level is designed to be more or less sensitive, and it is sometimes closed by circular glass stoppers cemented into the ends. When the tube is held horizontally, with the curved surface of the interior uppermost, the middle part is occupied by the air bubble. Lines are etched on the outer surface at equal distances from the central point, to enable the tube to be set with the bubble exactly in the middle, or a scale graduated throughout its entire length is provided, to enable any deviation from centrality to be measured and the corresponding dislevelment to be calculated and allowed for subsequently in the reduction of the observations. The glass tube is commonly fixed in a metal tube, with plaster of Paris for protection, but, as it is then liable, under changes of temperature, to torsion and strain, which may sensibly alter its curvature, it is preferable to place it in a metallic cradle and rest it on cork bearings, with due provision against sliding, the whole being covered with a glass cylinder if need be for further protection. The metallic cradle or tube is attached to any instrument on which the level is to be mounted by adjusting screws, for setting it correctly with reference to the axis of rotation with which it is associated. The value of a division of the scale, in seconds of arc, is usually called the "run," and is determined by attaching the level with its scale to a (generally) vertical circle, and taking both the circle and the bubble end readings in different positions of the circle. As the length of the bubble is much affected by changes of temperature, and the curvature of the tube may not be identical at all points, values of the run are commonly obtained under widely differing temperatures.

Tele
scope

The telescope consists of a tube, carrying an achromatic object-glass and an eye piece which holds either a pair of lenses for viewing

the inverted image transmitted by the object glass or a combination of four lenses for inverting the image and causing all objects to be viewed naturally. The former is usually employed for observing celestial objects, the latter for observing terrestrial. The field of view being more or less extensive, a central point is established in the tube, usually by the intersection of a pair of fine wires or spider lines—one vertical, the other horizontal—in the plane of the image, and the telescope is directed by bringing this point on any specific object in the field. As the interval between the object-glass and the image varies with the distance of the object, a tube is provided to slide within the telescope tube and carry the object-glass at one end, while the telescope tube carries the diaphragm and eye piece at the other end, or vice versa. The image and the wires are brought into the same plane by a focusing screw, which acts on the inner through the outer tube. The wires are attached to the surface of an adjustable annular diaphragm, which is held in position by two pairs of antagonizing screws—one pair horizontal, the other vertical—with shoulders working against the exterior of the tube in which the diaphragm is contained, so as to move it to the right or left and up or down, in order to bring the point of intersection of the wires into the visual axis of the telescope. In practice the first adjustment is to set the eye piece to distinct vision of the wires, the object glass is then set truly to focus which is accomplished when no apparent parallax, or movement of the image relatively to the wires, is seen on shifting the position of the eye, for this would indicate that the image is either in front of or behind the plane of the wires. The line joining the point of intersection of the wires with the centre of the object glass is called the "line of collimation," and the diaphragm should be so fixed that this line may always be perpendicular to the axis on which the telescope revolves.

The surveying compass gives the magnetic bearing of any object, Surveying is the simplest of all instruments for measuring horizontal angles. It consists of a magnetized needle, with anagate centre, placed on the point of an upright pivot in the centre of the bottom of a circular box and carrying a concentric circular card or silver ring, the circumference of which is graduated into 360°, and is sometimes further subdivided. The alidade is constituted by a pair of sight vanes attached to the box at opposite extremities of a diameter, one vane having a narrow slit for the eye to look through, the other with a wider opening bisected by a vertical wire to be set on the observed object. There is no circle reader, the prolongation of the wire on to the graduations being estimated by the eye, and there is no level, for the circle poses itself horizontally on the supporting pivot.

The prismatic compass is similar to the surveying compass, with the addition of a prism in the eye vane through which the wire of the compass sight vane and the divisions of the circle are viewed apparently past together, the division with which the wire coincides when the needle is at rest indicates the magnetic azimuth of any object bisected by the wire. The sight vane carries a mirror turning on a hinge, to enable objects to be seen by reflexion which may be too high to be seen on the wire, the eye vane is furnished with a pair of dark glasses to be employed when the sun is being observed.

Magnetic instruments are useful for rapid reconnaissance and rough survey, and for filling in the minor details of an exact survey, but they are not to be relied on to give bearings with errors less than ten to fifteen minutes. In plotting, however, bearings are preferable to angles, for, by drawing a number of meridional lines parallel to each other on the paper, each bearing may be plotted from an independent meridian without any accumulation of error, such as arises when a number of angles are plotted in succession with the protractor adjusted on short lines.

The plane table is in its usual form simply a rectangular board mounted horizontally on a stand, on which it may be turned round table and set in any required position, it is furnished with a slit sight rule, which usually carries a pair of sight vanes and has a bevelled edge, parallel to the line of sight, to serve as a ruler, also with a magnetic needle. Occasionally the construction is more elaborate, and the board is surrounded by a marginal frame with graduations radiating from the centre as the degrees of a circle, so that it may be used as an instrument for measuring horizontal angles, while the sight rule is furnished with a telescope, which takes the place of the vanes and is mounted on an axle to measure vertical angles. The size is made as great as is consistent with the limits of portability in each instance so that the sheet of paper to be drawn on may be as large as possible. The standard plane table of the Indian Survey measures 30 inches by 24, and is made of planks of well-seasoned wood 1 inch thick, with transverse edge bars below to prevent warping and buckling. It is set up on a stand, usually a braced tripod, to which it is clamped by a powerful hand screw passing through the head of the stand into a brass socket fixed centrally under the table, the screw when relaxed serves as a pivot, round which the table may be turned in azimuth and set in any required position. The table is then firmly clamped so as to maintain a constant position during all the subsequent laying off of bearings. The sight rule is 30 inches long, 2 wide, and one

third of an inch thick, of ebony, with a brass sight vane at each end, and a fiducial edge parallel to the line of sight, the vanes are about 5 inches high, which gives sufficient elevation and depression for general use. The magnetic needle is about 6 inches long and is held in a rectangular brass box an inch broad, placed on the table whilst it is being set and afterwards removed. Heights may be determined on the spot with the aid of a clinometer, formed of a bar carrying a spirit level and a pair of sights, one of which has a scale of tangents graduated to radians—the interval between the sights. For the method of employing the table see § 4, p 709 above.

Theodolite

The theodolite, the most important of all instruments for the purposes of a survey, is a combination of two graduated circles placed at right angles to each other, for the measurement of horizontal and vertical angles, a telescope, which turns on axes mounted centrally to the circles, and an alidade for each circle, which carries two or more readers of the arcs through which the telescope is moved. The whole is supported by a pedestal resting on foot screws, which are also employed to level the instrument. The size varies from a minimum with circles 3 inches in diameter to a maximum with a 36 inch horizontal and an 18 inch vertical circle, the weight ranging from 4 lb to 1000 lb, the dimensions and magnifying powers of the telescope increase with the diameter of the horizontal circle. The telescope may be connected rigidly with the alidade and move with it while the circle remains stationary, or with the circle and move with it while the alidade remains stationary. The varieties of form as well as of size are numerous in some the telescope may be completely turned round in altitude as well as azimuth, and pointed to any object celestial or terrestrial, in others the range of movement in altitude is restricted to about 25° above and 25° below the horizon, and a pair of sectors are substituted for the complete vertical circle, in some the telescope and vertical circle are placed between, in others outside of, the pillars which support their common axis, in some the pedestal is a simple tribrach resting on three foot screws, in others it takes the objectionable form of a ball carrying the vertical axis and a socket holding the ball between two parallel plates, which are antagonized and set firm by two pairs of foot screws, turning in sockets fixed to the lower plate, while their heads are pressed against the upper plate, to fix it and bring the instrument into level at the same time. There are numerous other specialities of form which have been introduced to meet specific requirements, but these cannot be noticed here.

Transit theodolite

The transit theodolite is an alt azimuth instrument with the graduated circles of equal diameter, usually 6 to 8 inches. The telescope is mounted between a pair of conical arms which taper outwards and end in cylindrical pivots, constituting what is called the transit axis of the instrument. The pivots rest on Ys or in semicircular collars, on the heads of a pair of pillars, which are made of sufficient height to enable the telescope to revolve between them and be pointed to stars in the zenith. These pillars stand on a circular plate, which serves as the alidade of the horizontal circle and is usually constructed to revolve round a vertical axis fixed in the centre of the plate of the horizontal circle, this axis passes downwards into a socket in the centre of a tribrach, which forms the pedestal of the instrument and rests on three mill-headed foot screws by which the instrument is levelled. The vertical circle is mounted centrally on one of the cones of the transit axis, near the pivot end, its alidade, usually a rectangular plate carrying a pair of verniers, is fitted centrally over that axis, in contact with the circle but nearer the shoulder of the pivot, and, while the telescope and the circle revolve together, it is held stationary by an adjustable arm the end of which is pinched between a pair of antagonizing screws mounted on the nearest pillar. The alidade of the horizontal circle carries two or three equidistant verniers, because any error in centring an alidade over a circle is eliminated in the mean of the readings whenever two or more verniers, placed at equal distances apart round the circle, are read. A clamp, with a tangent screw for communicating slow motion, is attached to the nearest pillar, to act on the vertical circle and the telescope, another is attached to the plate of the horizontal circle, to act on the alidade of that circle and so also on the telescope for azimuthal motion, and a third to the pedestal, to act on the plate of the horizontal circle. The first two are employed in measuring the vertical and azimuthal angles, the third in setting the zero diameter of the horizontal circle in any specific direction, with a view to the repetition of the measurements of the azimuthal angles at different parts of the circle. For levelling the instrument, two levels are fixed at right angles to each other on the plate of the alidade of the horizontal circle, a third is attached to the telescope, or, preferably, to the alidade of the vertical circle, a fourth is mounted on the transit axis when levelling for astronomical observations. A magnetic compass or needle is added, and also a plummet for centring the instrument over the station mark.

Theodolites are designed to measure horizontal angles with greater accuracy than vertical, because it is on the former that the most important work of a survey depends, and they are measurable with greatest accuracy, measures of vertical angles are liable to be

much impaired by variations in the refractive condition of the lower strata of the atmosphere, more particularly on long lines, so that when heights have to be determined with much accuracy the theodolite must be discarded for a levelling instrument, to be set up repeatedly with stakes at short distances. When truly adjusted the theodolite measures the horizontal angle between any two objects, however much they may differ in altitude, as the pole star and any terrestrial object, but, as adjustments are not always made with accuracy nor permanently maintained, it is desirable always to take the observations in pairs, with the face of the vertical circle alternately to the right and left of the observer, for this eliminates collimation error from the horizontal angles and index error in the setting of the spirit level from the vertical angles.

When a horizontal angle is measured several times for greater accuracy, one of two methods of procedure is adopted. (1) The angle is measured once or oftener in the usual way, the horizontal circle remaining clamped and the telescope and alidade moving over it, then the position of the horizontal circle is shifted¹ as often as may be desired, and after each shifting the angle is again measured as formerly, thus a separate numerical result is obtained for each operation. Or (2), the first object A having been observed and the telescope set on the second object B, the horizontal circle is unclamped and turned round until the telescope is brought back on A, when it is again clamped, then the alidade is unclamped and the telescope again moved over the horizontal circle to be set on B. The operation is repeated as often as may be desired. The former readings are only taken for the first telescope pointing to A and the last to B, their difference $\div 360^\circ$ for every complete revolution of the circle, divided by the number of repetitions, gives the angle. This method is objectionable when a round of several angles has to be measured, but it enables the value of a single angle—more particularly a small one, as between objects in the same field of the telescope—to be determined accurately with much greater rapidity than the first method.

An auxiliary telescope is sometimes fixed below the plate of the horizontal circle of a theodolite, to be pointed to a referring mark while the upper telescope is being moved about, and thus to serve as a check on the general stability of the instrument and on the permanency of the initial setting of the circle during the measurement of a round of angles. When a theodolite is set up on a lofty scaffolding which is liable to be swayed by the wind, or on a stand which cannot be readily isolated from the observer, horizontal angles may be measured accurately by employing a second observer to keep the auxiliary telescope truly pointed to a referring mark while the observing telescope is being pointed.

The subtense transit theodolite differs from the ordinary transit theodolite merely in having a pair of wire carrying micrometers transit mounted in the telescope tube, in order that the small angle subtended by a distant object of known dimensions, or by two objects like sufficiently near each other to be seen in the same field of the telescope, may be measured with greater facility and precision than on the graduated circles in the usual way. The micrometers are held in a rectangular box, one on the right hand, the other on the left, with the wires brought as closely as possible into the plane of the fixed wires in the ordinary diaphragm, the box can be turned on the telescope tube through an angle of rather more than 90° , to enable the micrometer wires to be set parallel to either the horizontal or the vertical wire of the diaphragm, or to be placed at any desired angle of inclination. The subtense object usually employed in survey work is a pole of known length, if held perpendicularly to the line of sight of the telescope, its direct distance may be determined from the angle measured by the micrometers with a sufficiently small percentage of error to make this method preferable to chaining over rough ground. The instrument has been advantageously employed in carrying traverses of considerable length over ground which was impracticable for direct linear measurements. The micrometers are also serviceable in astronomical observations for time and longitude, for they give additional wires on which to observe the passage of a star, at distances from the fixed wire which may be varied with the speed of the star, and for determining the longitude they permit numerous measures of the distance between the edge of the moon and a star to be taken, immediately before and after occultation.

Eckhold's omniometer is a theodolite furnished with a microscope field of considerable magnitude facing a graduated linear scale, the tube held of the microscope is rigidly attached to the telescope tube, either at right angles or parallel to it, so that the two always move together. The scale is fixed either parallel or perpendicular to the alidade plate of the horizontal circle, thus, when the telescope is moved through vertical arcs within the range of the scale, the tangents of the arcs are measured by the microscope on the scale. The latest and best form of the instrument is shown in fig. 8, which represents a transit theodolite converted into an omniometer by the application of a microscope *AL* to the telescope at right

¹ This is often done arbitrarily but systematic shifts which bear equal constant graduations of the circle under the verniers during all the telescope pointings to any one object are always preferable (see sect. 1, § 4 p 709 above).

angles to it, and of a scale *C* to the plate of the alidade of the horizontal circle in a plane parallel to that of the vertical circle. The

microscope is furnished with a diagonal eyepiece through which the observer looks down on the scale. The scale is divided into 100 equal parts, and is movable in its body through the length of one of these divisions by one rotation of a micrometer screw, with a large head, *D*, the circumference of which is divided into 100 equal parts, each divisible into fifths by a vernier. The microscope has a fixed wire in a diaphragm at its eye end, *A*, and, when the telescope is set on an object and the wire is seen between a pair of divisions on the scale the scale is

moved by the micrometer screw until the nearest division is brought under the wire, the scale reading corresponding to the horizontal position of the telescope being known, the difference between it and the reading when the telescope is pointing above or below the horizontal plane is the tangent of the arc of elevation or depression, to radius = the perpendicular from the axis of rotation of the telescope to the scale. Thus

both the distance and the height of any point over which a staff of known length has been set up vertically may be readily determined with fair accuracy. Let *O* (Fig 9) be the position of the

Fig 9

transit axis of the telescope, *Oa* the direction of the telescope when horizontal, and *Oq* the corresponding direction of the microscope at right angles to the scale axis, let *M* be a distant point over which the staff *MN* has been set up vertically, and let *a* and *q* be the graduations under the microscope when the telescope is pointing to the bottom and top of the staff, then since *MN* and *Oq* are known the horizontal distance *Oa* and the height *AM* are determined from the proportions

$$\frac{Oa}{AM} = \frac{Oq}{MN} \quad \text{or} \quad MN = \frac{Oq \cdot AM}{Oa}$$

It is essential that the focusing tube of the microscope should always move parallel to the visual axis when different divisions of the scale are being brought into focus otherwise errors materially exceeding the quantities allowable by the micrometer may be caused. The linear results thus obtained are satisfactory when the subse staff is set up at a moderate distance, the instrument has often been used with advantage in local measurements where measuring chains could not be conveniently employed. As an angular instrument it is identical with the ordinary transit theodolite as will be seen from the figure which may be referred to as illustrating the description of that instrument. The foot-screws are reversed as being on a plate such as is usually fixed on the head of a theodolite stand, their lower extremities as well as the grooves in which they are placed on the plate, being concealed from view by a carrying upper plate, which is clamped over the shoulders to prevent the instrument from falling off the stand.

In any telescope with a telescope of the ordinary form the horizontal of the plate must necessarily be somewhat greater than half the length of the telescope if set in the zenith or to be observed on higher the pillar the higher the centre of gravity, the less perfect the adjustment of the instrument when set up for observation, and the greater is weight and cumbersome for transport. In Germany and France theodolites and transit instruments are sometimes en-

ployed in which the eye end of the telescope tube is removed—a counterpoise to the object end being substituted in its place, and a prism is inserted at the intersection of the visual axis with the transit axis, so that the rays of light from the object glass may be reflected through one of the tubes of the transit axis to an eyepiece in the pivot of the tube. In this case the pillars need not be high enough for the counterpoise to pass freely over the plate of the horizontal circle, but the observer has always to place himself at right angles to the direction of the object he is observing.

The levelling instrument consists of a telescope which carries a levelling long spirit level parallel to its line of vision and a horizontal instrument plate which is fixed rigidly either on the head of a vertical axis or revolving within a socket in the centre of the pedestal or on that of a hollow cone revolving round a vertical axis which projects upwards from the pedestal. There are various forms of the instrument, in the Y level the telescope is on a pair of Y's in which it can be both rotated and fixed end for end in the diaphragm; the telescope is rigidly attached to its supports and its tube is made of iron and of greater diameter to carry an oblique plate of shorter focal length and larger aperture. A magnetic compass is attached to the instrument to enable the bearings of the levelling stakes to be taken whenever desired. Levelling staves are of a variety of patterns and are graduated in various ways on both faces and the staves, for a check on accidental errors of reading as indicated in sec. III.

Perfecting levels are portable instruments which may be held by the hand for rough and rapid survey work. There are two forms levels in one an image of the eye of the observer in the horizontal image of the bubble of a spirit level, is seen by reflection on a level with the observed object. The first consists of a square of colourless looking glass, which is set in a frame suspended from a ring on the line of prolongation of one of the diagonals in such a manner as to swing freely but not turn round on its axis of suspension, the frame is weighted by a metal plate behind, to which it is so adjusted that when suspended, the plane of the surface of the mirror will be vertical. A small portion of the glass at one end of the horizontal diagonal is cut out away or notched. When the image of the observer's eye is seen on the diagonal, all objects behind him in the diagonal will be seen through the opening in the mirror. The second form is a telescope with a spirit level, the bubble of which is fixed in the tube far as the vertical axis of the telescope is fixed in the axis of the telescope. The telescope is of a construction but with the spirit level attached to the axis of a level graduated angles are fixed to one side of the telescope, the vertical angles as well as levels marked on the telescope.

The optical square is a reflecting instrument in which a right optical angle and is of great use in laying off perpendiculars for the square measurement of offsets from a line of survey. It consists of two glass plates one wholly reflecting the other partially reflecting. The partially reflecting plate is in a shallow notch but at an angle of 45° so that any two objects seen together through a slit in the box—one direct through the transparent portion of the partially reflecting mirror of the partially reflecting glass plate—the other at an angle of 90° at the point where the reflecting surface is a line.

The common compasses, and angular protractors for laying off as run on angles and angles measured on the ground, protractors, compasses and pantographs for reproducing a scaled plan on a smaller scale, and opisometers and planimeters for measuring plotted lines and areas.

Scales are divided, either decimally or fractionally into equal scale parts, each of which is a portion of a fixed unit of length, as a foot or an inch, some are subdivided more or less minutely through out their entire length between a pair of parallel lines; others are subdivided at the extremities only. Diagonal scales are formed by even equidistant parallel lines the outer ones of which are divided primarily and subdivided into tenths of their entire length. The primary divisions are joined by cross lines perpendicular to the even parallel lines; the end subdivisions are joined diagonally the first on the lower line with the second on the upper line and so on, each diagonal cutting every horizontal line in a point a tenth of a subdivision beyond the cutting point on the lower line or as measured from any one of the parallel lines, and each of these tenths is further divisible into tenths by assuming lines thus graduated as a means of measurement.

The Marquand scale and triangle consist of a scale divided into angles ranging from 0° to 90° and a right-angled triangle. An arrow is drawn perpendicular to the hypotenuse to serve as a pointer to the divisions of the scale. The triangle has a bevelled edge for ruling. When the triangle is placed with its hypotenuse against the scale and is moved along it a line is drawn

along the bevelled edge are parallel to each other, their distances apart being one third of the distances travelled by the arrow along the scale.

Compasses Compasses usually take the form of a pair of legs movable about a joint, so that their extremities, which are of steel, finely pointed, may be set at any required distance apart, the legs may be knee-jointed, and one is usually adapted to hold either a pencil, a ruling pen, or a steel pointer, as may be desired. A beam compass is employed when long lengths are laid off, it consists of a light tubular metal bar, or a rectangular deal rod, fitted with a pair of boxes, which slide along it and carry either pen, pencil, or pointer, and may be set and clamped at any desired distance apart.

Proportional compasses Proportional compasses consist of two parts so exactly similar that when held in contact throughout they appear as one, each is pointed at both ends, flat and grooved through one half its length, and tapering to a point in the other half. The two are coupled together by a pair of similar sliders, one for each groove, turning on a common axle which carries a disk at one end and a clamping screw at the other, by shifting the position of the sliders in the grooves the distances between the points at the opposite ends can be brought into any desired proportion. The settings for different proportions are effected by bringing a line on the slider opposite the lines of a fractional scale engraved on one side of the groove.

Protractors Protractors are of two forms circular (or semicircular) and rectangular, the circumferences of the former are divided into 360° or 180° , the latter are divided on three sides of their periphery by lines drawn from the centre of the fourth side to the degree points on the circumference of a semicircle of which that side is the diameter. The protractor being set with its centre on a given point and its zero line on a given line passing through the point, any angle with this line at the point can be readily laid off. Protractors for plotting traverses are commonly annular, that they may be centred over the station of origin with the zero diameter on the initial meridian, their bearings at any other station may be laid off without moving the protractor by drawing lines parallel to the same bearings at the origin. Rectangular protractors sometimes have parallel lines engraved on their faces at equal distances, for setting over paper ruled with parallel lines at unequal distances, and their backs engraved with scales of rhumbs, sines, secants, and tangents and common scales of equal parts.

Station pointer The station pointer enables the position of any station at which angles between three fixed points have been measured to be plotted on paper. It consists of three arms the centre arm carries a graduated circle fixed over an axis at one end, the other two are movable round this axis, and each carries a vernier for reading the circle. Each arm has a straight edge bevelled as a ruler, and the lines on the prolongations of these edges meet in the centre of the axis, where there is a small opening through which a point may be pricked on the paper. The arms having been set to the observed angles, the instrument is moved about until each edge is over one of the fixed points on the paper, when its centre will be exactly over the position of the station if none of the angles are very acute. The instrument is much used in nautical surveying, for laying down the position of a vessel at sea by angles measured to fixed objects on shore.

Triangular compass The triangular compass is serviceable in reproducing plans to full scale, it is formed by jointing a third leg to the centre pin of the joint of an ordinary pair of compasses, so as to be movable in any direction.

Pantagraph The pantagraph is employed in reproducing a map on a different—generally a smaller—scale. It consists of two long arms, AB and AC , jointed together at A , and two short arms, FD and FE , jointed together at F and with the long arms at D and E , FD is made exactly equal to AE and FE to AD , so that $ADFE$ is a true parallelogram whatever the angle at A . The instrument is supported parallel to the paper on ivory castors, on which it moves freely. A tube is usually fixed vertically at c , near the extremity of the long arm AC , and similar tubes are mounted on plates which slide along the short arms BD and FD , they are intended to hold either the axle pin on a weighted fulcrum round which the instrument turns, or a steel pointer, or a pencil, interchangeably. When the centres of the tubes are exactly in a straight line, as on the dotted line $b'c$, the small triangle $b'D$ will always be similar to the large triangle $b'cA$, and then, if the fulcrum is placed under b , the pencil at f , and the pointer at c , when the instrument is moved round the fulcrum as a pivot, the pencil and the pointer will move parallel to each other through distances which will be respectively in the proportion of $b'f$ to $b'c$, thus the pencil at f draws a reduced copy of the map under the pointer at c , if the pencil and the pointer were interchanged an enlarged copy would be drawn, if the fulcrum and pencil were interchanged, and the sliders set for f to bisect $b'c$,

Fig 10

the map would be copied exactly. Lines are engraved on the arms BD and FD , to indicate the positions to which the sliders must be set for the ratios $\frac{1}{2}$, $\frac{2}{3}$, which are commonly required.

The square pantagraph of Adrian Gaviard consists of two graduated Gaviard arms which are pivoted on a plain bar and connected by a graduated square bar sliding between them throughout their entire length, to be set parallel at any required distance from the plain bar, a sliding plate carrying graph a vertical tube, to hold either the axle of the fulcrum, the pencil, or the pointer, is mounted on one of the arms and on a prolongation of the plain bar beyond the other arm, and also on the graduated connecting bar, and an additional arm is provided by means of which reductions below or enlargements above the scales given on the instrument can be readily effected.

The eidograph is designed to supersede the pantagraph, which is somewhat unsteady, having several supports and joints. It is graph composed of three graduated bars, one of which is held over a fulcrum and carries the others, which are lighter, one at each extremity. The three bars are movable from end to end in box sockets, each having an index and a vernier in contact with the graduated scale. The box socket of the principal bar turns round the vertical axle of the fulcrum, that of each side bar is attached to a vertical axle, which also carries a grooved wheel of large diameter and turns in a collar at either end of the principal bar. The two wheels are of exactly the same diameter and are connected by a steel band fitting tightly into the grooves, so that they always turn together through identical arcs, thus the side bars over which they are respectively mounted, when once set parallel, turn with them and always remain parallel. A pointer is held at the end of one of the side bars and a pencil at the diagonally opposite end of the other. The bars may be readily set by their graduated scales to positions in which the distances of the pencil and the pointer from the fulcrum will always be in the ratio of the given and the required map scales.

The opisometer is intended to measure the lengths of roads, rivers, Opiso and other lines on a map. It consists simply of a milled wheel meter mounted in a forked handle on a steel screw with a very fine thread. The wheel, being turned up to one end of the screw, is put down on the map with the handle held vertically over the point at which the measurement is to commence, and is run over the road or line until the point is reached at which the measurement is to stop, it is then lifted off the paper, placed on the scale of the map, and run backwards to the initial end of the screw, over a length of the scale which corresponds to the length run over on the map.

The polar planimeter was invented by Professor Amsler of Polar Schaffhausen for the measurement of areas on maps and plans. It consists essentially of two arms jointed together and a roller, carried at right angles to one of the arms and moving in touch with the paper, which by its revolutions records the area of a figure whose perimeter is traced by a point on that arm, while the instrument is turned bodily on a point on the other arm as a fixed centre. There are two forms of the instrument, in one the position of the roller is fixed and the arms are jointed on a common pinion, in the other the roller and a pinion, to which the holding arm is attached, are both carried by a slider, which is movable along the tracing arm and can be set at any required distance from the tracing point. The first form gives areas in a single unit of measure only, the second in various units.

The annexed figure represents the first form, showing the joint A , the tracing point P , the fixed point O , and the roller with its graduated dial and vernier, for indicating the lengths of line rolled over while the tracer moves round the perimeter of the area under measurement.

The following explanation of the theory of the instrument is due to Professor Greenhill. Let OA , AP be the two arms jointed at A , with the fixed point at O and the tracer at P , and suppose the wheel to be fixed at R on the prolongation of the arm PA . Let $Oa = a$, $AP = b$, $AR = c$, and the radius of the roller $= r$, and let the direction of a positive rotation of the roller, as marked by the graduations, be that of rotation on a right handed screw on the axle of R which would give motion in the direction AR . Drop the perpendicular

Fig 11

Fig 12

OI from O on AR , and first suppose the joint A to be clamped. Then, if I is in AP produced, a rotation of the instrument about O with angular velocity ω will give to P the component velocities $OI\omega$ in the direction IP and $PI\omega$ in the direction perpendicular to IP , and will therefore compel the roller to turn with the angular velocity $\frac{PI}{r}\omega$, but, if I is on the other side of R , the angular velocity of the roller will be $-\frac{PI}{r}\omega$. Therefore, keeping A clamped, the roller will turn through an angle $\frac{RI}{r}\theta$ or $-\frac{PI}{r}\theta$, according as I is or is not on the same side of P as A , when the instrument is rotated through an angle θ about O but, when I coincides with R , the roller will not turn, and then P describes a circle, called the "zero circle, represented by the middle dotted circular line, of radius

$$\sqrt{(OP^2 - RP^2)} = \sqrt{(a^2 - c^2 - (b+c)^2)} = \sqrt{(a^2 - b^2 - 2bc)}$$

Next unclamp the joint A and clamp the arm OA , then the roller will turn through an angle $-\frac{c}{r}\phi$, while AP turns through an angle ϕ

Now suppose P to travel round the finite circuit $PP_1P_2P_3$ by a combination of the preceding motions in the following order (1) Clamp the joint, and move P to P_1 and A to A_1 on arcs of circles of centre O , then the roller will turn through an angle $\frac{PI}{r}\theta$,

θ being $\angle AOA_1 = \angle POP_1$ (2) Unclamp the joint and clamp the arm, and move the pointer from P_1 to P_2 on the arc of a circle of centre A_1 then the roller will turn through an angle $= -\frac{c}{r}\phi$, ϕ

being $\angle P_1A_1P_2$ (3) Unclamp the arm and clamp the joint, and move the pointer from P_2 backwards to P_3 and A_1 to A , on arcs of circles of centre O , through an angle θ , then the roller will turn through an angle $-\frac{PI}{r}\theta$, if OI_1 is the perpendicular from O on P_2A

(4) Unclamp the joint and clamp the arm, and move the pointer from P_3 to P on the arc of a circle of centre A , and consequently

through an angle ϕ , the roller will turn through an angle $\frac{c}{r}\phi$, which cancels the angle due to motion (2) Thus in completing the finite circuit $PP_1P_2P_3$ the roller will have turned through an angle $(PI - RI_1)\frac{\theta}{r} = (AI - AI_1)\frac{\theta}{r}$

$$\begin{aligned} \text{But the area } PP_1P_2P_3 &= \text{area } PP_1O_1O_2 \\ &= \text{sector } OPP_1 - \text{sector } OQQ_1 = \frac{1}{2}(OP^2 - OQ^2)\theta, \\ &= \frac{1}{2}(OA^2 - AI^2 + 2AI \cdot AP - (OA^2 - AI^2) \\ &\quad - 2AI_1 \cdot AP)\theta, \\ &= (AI - AI_1)AP\theta, \\ &= br \text{ times the angle turned through by the roller} \end{aligned}$$

The area $PP_1P_2P_3$ is therefore b times the travel of the circumference of the roller

Any irregular area, supposed to be built up of infinitesimal elements found in the same manner as $PP_1P_2P_3$, will be accurately measured by the roller when the point P completes a circuit of the perimeter, the arm AP being free to turn on the joint at A and the arm OA on a fixed point O . If, however, O is inside the area, the area of the zero circle must be added to the area deduced from the readings of the roller. When the roller is fixed permanently, this area is constant, and is usually engraved on the arm in units of the adopted length b , when the roller is held on a slider which also carries the pinion of the arm OA , the length b may be so adjusted that the areas described will be expressed in any desired unit of measure

SUSA, the Biblical SHUSHAN, capital of Susiana or Elam and from the time of Darius I. the chief residence of the Achæmenian kings, was a very ancient city, which had been the centre of the old monarchy of Elam and undergone many vicissitudes before it fell into the hands of the Persians (see ELAM). The site of the town, which has been fixed by the explorations of Loftus and Churchill, lies in the plain, but within sight of the mountains, between the courses of the Kerkha (Choaspes) and the Dizful, one of the affluents of the Pasitigris. The Shâpur, a small tributary of the Dizful, washes the eastern base of the ruin-mounds of Sus or Shush. Thus the whole district was fruitful and well watered, fit to support a great city, the surrounding rivers with their canals gave protection and a waterway to the Persian Gulf, while the position of the town between the Semitic and Iranian lands of the empire was convenient for administrative purposes. It is not therefore surprising that Susa became a vast and populous capital, Greek writers assign to it a circuit of 15 or 20 miles,—a statement which is fairly well borne out by the remains. These include three main mounds, of which one is identified with the strong citadel¹ and a second shows the relics of the great palace built by Darius I. and completed by Artaxerxes Mnemon. Susa was still a place of importance under the Sassanians, and after having been razed to the ground in consequence of a revolt seems to have been rebuilt by Shâpur II. under the name of Êrînsâhr-Shâpur (Noldeke, *Gesch. d. Perser aus Tabari*, p. 58). The fortifications were destroyed at the time of the Moslem conquest (Mokaddasi, p. 307), but the site, which is now deserted, was inhabited in the Middle Ages, and a seat of sugar-manufacture.

In Daniel viii. 2 the river of Shushan is called Ulai, a name which is identical with Arrai of the Bundehesh and Eulens of classical writers. What is told of the Eulens makes it impossible to identify it with the inconsiderable Shâpur, but authorities differ as to whether it is another name for the Choaspes or rather denotes

the Dizful or the Pasitigris. Susa in the days of its greatness must have stretched nearly from river to river. There is a sanctuary of the tomb of Daniel on the banks of the Shâpur, and Arabic geographers relate that this tomb was a frequented shrine before the Moslem conquest and that the Arabs turned the stream over the grave.

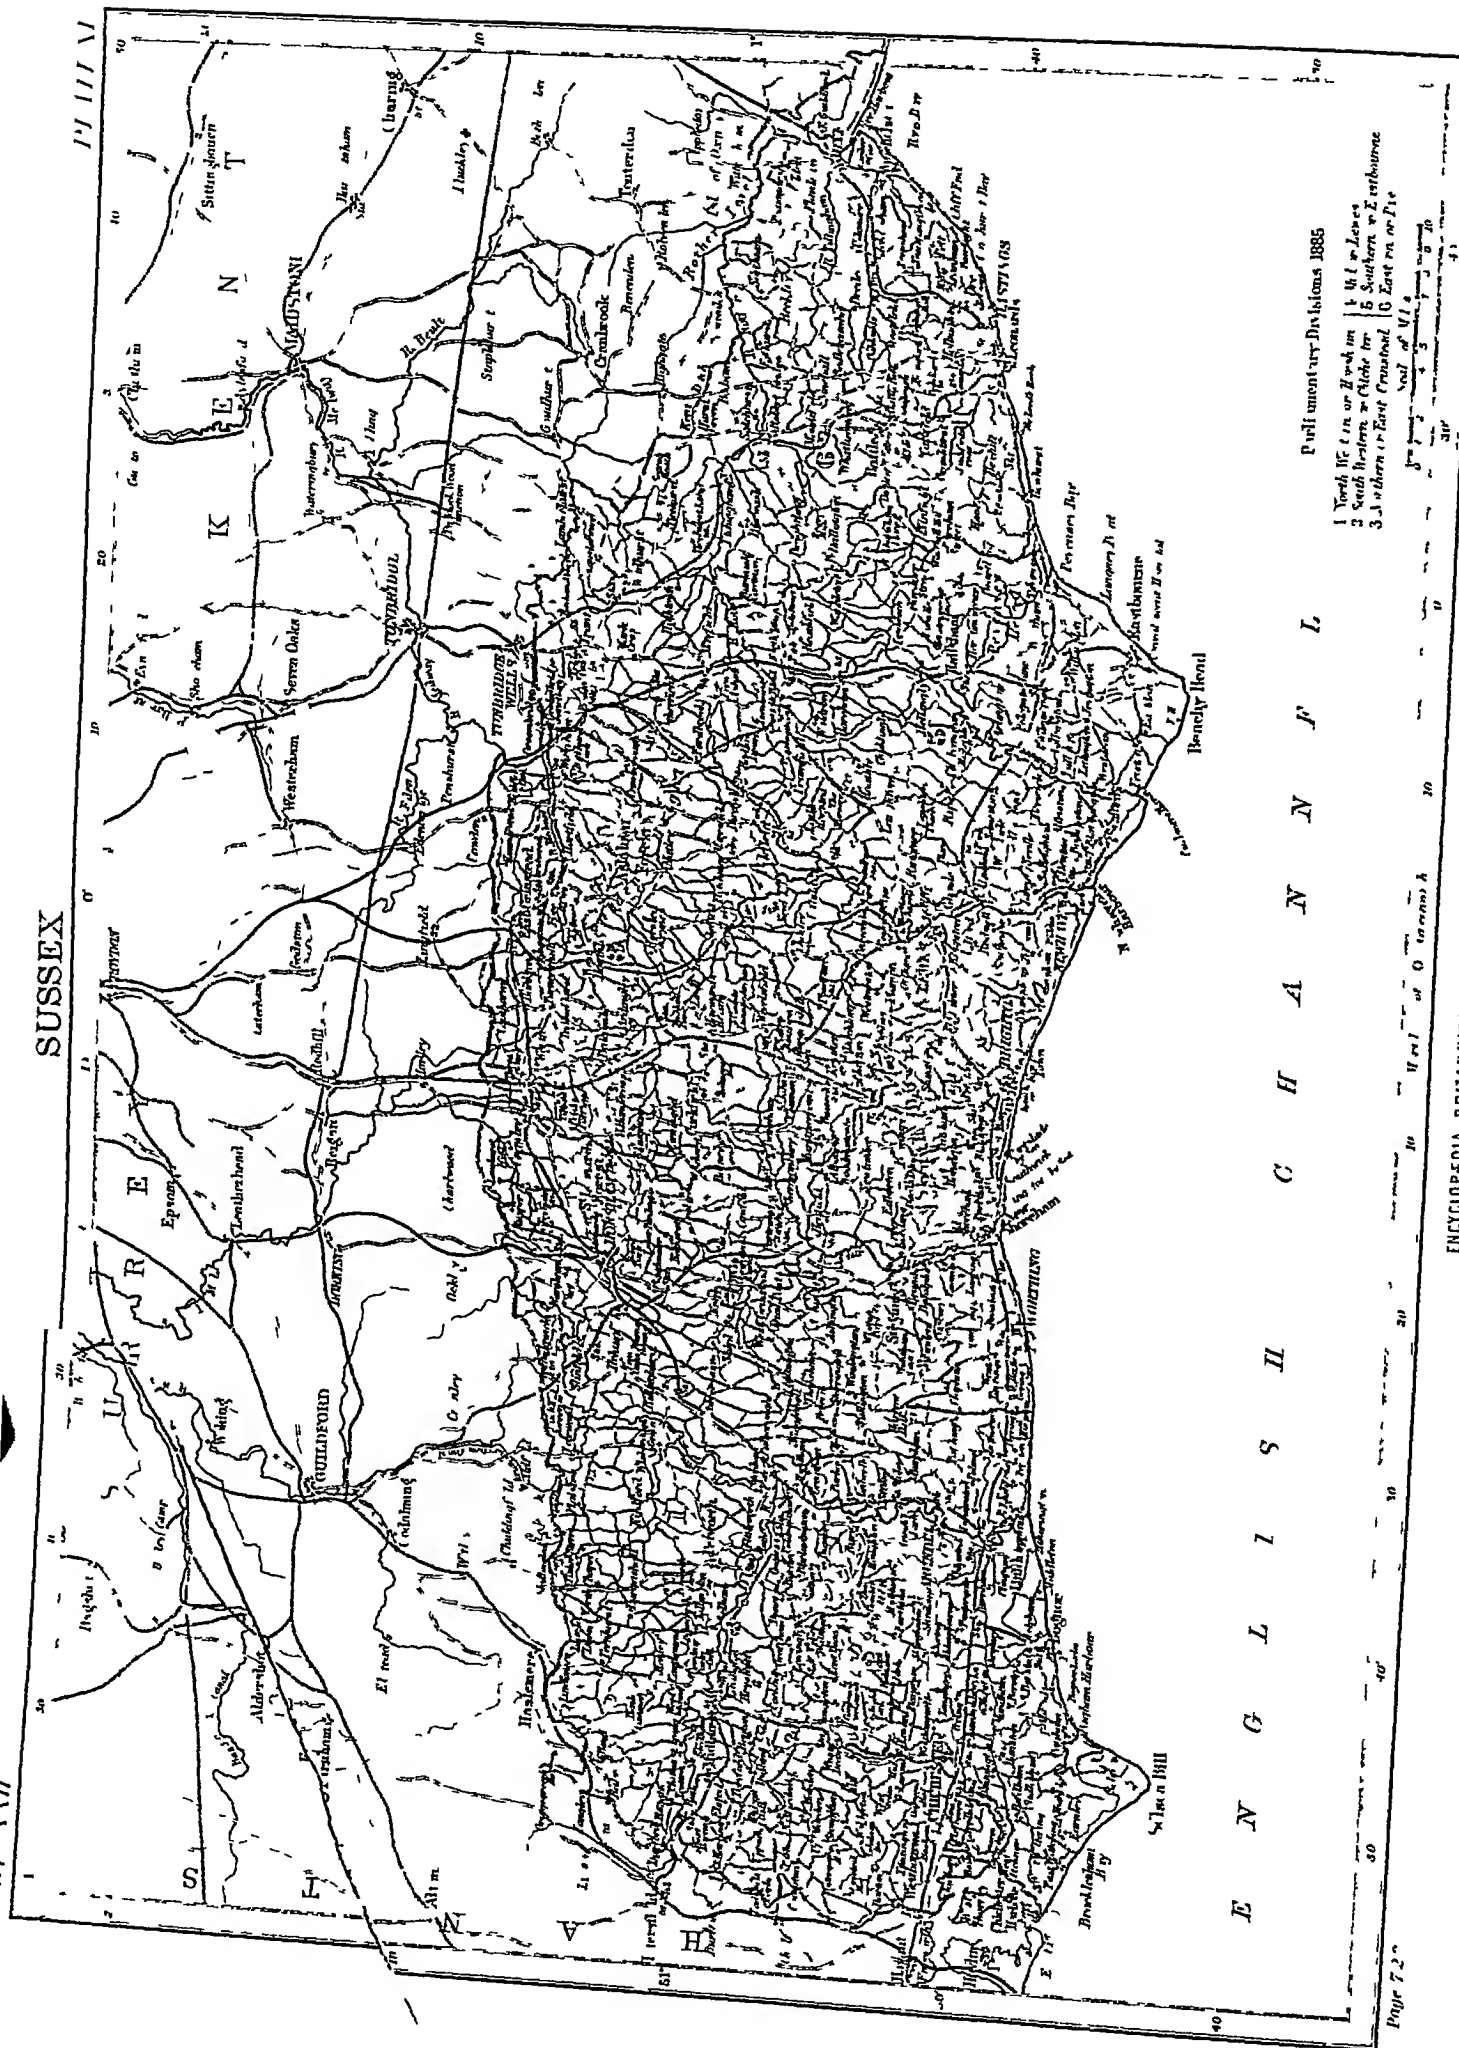

SUSA, a city of Italy, in the province of Turin, 33½ miles west of Turin by the railway which passes by the Mont Cenis tunnel into France, is situated on the Dora Riparia (tributary of the Po) at 1625 feet above the sea, and is so protected from the northern winds by the Rocciamelone that it enjoys a milder winter climate than Turin itself. The city walls, 20 to 30 feet broad at the base, were about 50 feet in height, but in 1789 their ruinous condition caused them to be reduced by about half their elevation. Numerous remains of Roman buildings and works of art still show the importance of the ancient town, and the triumphal arch erected by Cottius in honour of Augustus still stands on the old Roman road between Italy and Gaul,—a noble structure, 45 feet high, 39 broad, and 23 deep. The inscription, now illegible, mentioned fourteen "civitates" subject to Cottius. Among the modern buildings of Susa the first place belongs to the church of San Giusto, founded in 1029 by Olderico Manfredi II. and the countess Berta, and in 1772 raised to be the cathedral. The population of the city was 3254 in 1871 and 3305 in 1881 (commune, 4418).

Segusio (also Secusio, Siosium, Sentium, Seucia, &c.) was at a very early period the chief town of this Alpine region, and the Cottian Alps themselves preserve the name of the Segusian chief Cottius, who with the title of prefectus became a tributary and ally of Rome in the reign of Augustus, and left his state strong enough to maintain its independence till the reign of Nero. As a Roman municipium and military post Segusio continued to flourish. After the time of Charlemagne a marquise of Susa was established, and the town became in the 11th century the capital of the famous countess Adelaide, who was mistress of the whole of Piedmont. On his retreat from Legnano, Barbarossa set fire to Susa, but the town became more than ever important when Emmanuel Philibert fortified it at great expense in the 16th century.

SUSA (Sûsa), a city of Tunis, on the coast of the gulf of Hamâma, 33 miles south of Hamâma. It occupies the side of a hill sloping seawards, and is still, as far as the town proper is concerned, surrounded with heavy white-

¹ The Greeks called the citadel the *Μεγίστηρος* (Strabo, xv. 3, 2), and supposed it to have been founded by the Ethiopian Memnon. It was strong enough to withstand Molon in his war with Antiochus the Great (Polyb., v. 45).

washed Oriental-looking walls. The *Kas al-Rabât*, a square building flanked by seven bastions, was probably either a Roman or Byzantine fortress, and a Byzantine chapel is now transformed into the *Kahwat al-Kubba* or Café of the Dome. Since the French annexation the citadel, built on the highest point within the town, has been entirely restored and serves as the headquarters of the general commanding a division, and a camp of tile-roofed brick buildings has been erected in the neighbourhood. The space within the walls is proving too limited for the growth of the population, and houses already extend along the shore to north and south for about a mile. Susa is the ancient seaport of Kairwan (45 miles inland), with which it is connected by a horse-tramway, and it has a rapidly increasing commerce. In 1864 the port was visited by about 195 vessels, in 1885 by 701, of which 532 were Italian. The exports in 1885 were valued at £1,371,510 (oil, to Genoa and Leghorn, £232,530, grain, largely to Sicily, £397,760, *sansa* or olive refuse, to France, £13,715, esparto, a comparatively recent article for this port, £17,935), and the imports (including building-stone from Sicily and Malta, brick, lime, marble, and timber) amounted to £660,135. The population, which numbered 8000 in 1872 (2000 Jews, 1000 Christians), had increased to upwards of 10,000 in 1886.

Susa is the ancient *HADRUVRUM* (*q.v.*). In 1537 it was besieged by the marquis of Terranova, in the service of Charles V., and in 1539 was captured for the emperor by Andrea Doria. But as soon as the imperial forces were withdrawn it became again the seat of Turkish piracy. The town was attacked by the French and the Knights of St John in 1770, and by the Venetians in 1764.

SUSANNA ("Lily"), the heroine of one of the apocryphal additions to the Greek text of the book of Daniel, the others being the *Song of the Three Children* and the story of *Bel and the Dragon*. In the English version the story of the virtuous Susanna—the false accusation brought against her by the elders and her deliverance by the judgment of Daniel—is put as a separate book. Jerome, in his *Preface* to Daniel, points out that it had been observed both by Jews and Christians that this story was certainly written by a Greek, and not translated from Hebrew, since Daniel makes a series of Greek puns on the names of trees.

Plat. XI SUSSEX, a maritime county in the south of England, lying between 50° 43' and 51° 9' N lat and 0° 49' E and 0° 58' W long. It is 76 miles from Lady Holt Park to Kent Ditch, and 28 miles from Tunbridge Wells to Beachy Head, and adjoins Kent on the N.E., Surrey on the N., Hampshire on the W., and the English Channel on the S. Its total area is 933,269 acres or 1458 square miles.

Hills The range of chalk hills known as the South Downs divides the county into two districts—that of the coast and that of the Wealden—which are of unequal extent and possess very different characteristics. In the western part of the county the South Downs are about 10 miles distant from the sea, they continue eastwards for about 45 miles, and terminate in the bold headland of Beachy Head. Their average height is about 500 feet, though some of the summits reach 700 (Ditchling Beacon, 813 feet, Chanctonbury Ring, 783, Fittle Beacon, 700, and the Devil's Dyke, 697). The Forest Ridge extends through the northern part of the county from Petworth to Crowborough, reaching the coast in Fairlight Down. The principal summits are Crowborough Beacon (796 feet), Brightling Hill (647), and Fairlight Down (528). The county has suffered greatly from incursions of the sea. The site of the ancient cathedral of Selsey is now a mile out at sea. Between 1292 and 1340 upwards of 5500 acres were submerged. In the early part of the 14th century Pagham harbour was formed by a sudden irruption of the sea, devastating 2700 acres. Recently all this land has been reclaimed and again brought under cultivation.

There is considerable reason for believing that the whole coast-line of the county has been slightly raised in the last 800 years (possibly by earthquake shock), as the large estuaries at the river mouths no longer exist, and the archipelago round Pevensey (*eye* signifies "island") has only a slight elevation above the neighbouring marsh land.

The rivers are small and unimportant. The principal Rivers are the Rother, the Cuckmere, the Ouse, the Adur, the Arun, and the Lavant. The Rother rises in the Forest Ridge, in the parish of Rotherfield, and enters the sea near Rye, its course having been diverted by a great storm on 12th October 1250, before which date its exit was 12 miles to the east, beyond Dungeness. The Cuckmere also rises in the Forest Ridge, near Heathfield, and empties itself into the sea a little to the east of Seaford. The Ouse rises in St Leonards Forest, to the north-west of Lindfield, and, passing through Isfield and Lewes, enters the sea at Newhaven, now the principal port in the county. The former outlet was at Seaford, but in the reign of Elizabeth the sea broke through the beach bank at some warehouses just below Bishopstone and formed what is now called the old harbour, which was in use until the Newhaven one was made a safer exit. The Adur has three sources, all in the neighbourhood of St Leonards Forest, and flows southwards, entering the sea at Southwick. The mouth of the river formerly shifted from year to year, ranging both east and west over a distance of 2 miles. The Arun rises in St Leonards Forest, in the parish of Shalford, flows through Amberley and Arundel, and enters the sea at Littlehampton. The Lavant has its source in Charlton Forest and encircles Chichester on all sides except the north, entering the sea through creeks in the extreme south-west corner of the county.

The portion of the county to the north of the South Forest Downs is called the Weald, it formerly formed part of the forest of Andredswald ("the wood or forest without habitations"), which was 120 miles in length and about 30 in breadth. The total area of forests in 1885 was 113,013 acres, being the greatest of any county in England. About 1660 the total was estimated at over 200,000 acres. The chief remains of the ancient forests are Tilgate, Ashdown, and St Leonards, but the names in many parts indicate their former wooded character, as Hurstpierpoint (*hurst* meaning "wood"), Midhurst, Fernhurst, Billingshurst, Ashurst, and several others. The forests were interspersed with lagoons, and the rainfall being very great caused marshes and the large river estuaries, the rainfall, however, abated in consequence of the cutting down of the Wealden forests for fuel in the extensive ironworks that formerly existed in that district. The wood was exported in the reign of Edward VI.

The greater portion of the county is occupied by the Geol. Chalk formation, of which the South Downs are almost entirely composed. Firestone is found in the west, and Steyning is built upon it. At the base of the Downs the Greensand crops up, but is of small extent. The Wealden formations occupy nearly all the inland district of the county, and in these was found the ironstone from which iron was extracted. Sussex was at one time the centre of the English iron manufacture, before 1673 there were 12 iron forges or mills (reduced to 18 before 1667) and 27 furnaces (reduced to 11 before 1661), which employed 50,000 men¹ and furnished the main supply of ordnance for the national defence. The last forge at Ashburnham was not extinguished until 1809. Between 1872 and 1876 boring was carried on at Netherfield, near Battle, with the object of discovering what beds were below the Wealden, and if possible of reaching the Palaeozoic rocks, which at

¹ *Suss Arch Coll*, xxxii pp. 22-23

Kentish Town, Harwich, Ostend, and Calais had been found at a depth of about 1000 feet below the sea-level. Some slight hope was entertained of the occurrence of Coralline measures, as in the Boulonnais the Carboniferous limestone, where last seen, dips south. The boring was continued to a depth of 1905 feet, the Oxford Clay being reached. The chief result was the discovery of the unusual thickness of the Kimmeridge Clay, which began at 275 feet from the surface and continued to a depth of about 1469 feet. The most practical result was the finding of thick beds of gypsum (at about 160 feet), which were before unknown in the Weald and are now worked at Netherfield. From Beachy Head to Selsey Bill there lies, south of the Downs, a low and level tract belonging to the Tertiary period, of which there is no such record at any other place in England. The towns of Hove, Worthing, Littlehampton, Bognor, &c., are built on gravel, sand, and loam of the Post-Pliocene or Pleistocene series, and these superficial beds overlie the Eocene series in patches and contain a large fossil fauna. Remains of the mammoth occur in the mud deposit (or *Lutricia* clay) of this district, and the Chichester museum contains the greater portion of a fine skeleton of the *Elephas antiquus* obtained off Selsey Bill. Of the British Quaternary fossils forty-five are peculiar to Selsey, and twenty others probably find here their earliest place in British geological history. The Bracklesham beds occur at the bay of that name, and their main divisions extend from Wittering on the west to the Barn Rocks, east of Selsey Bill, a distance of 7 miles. They are full of fossil shells, particularly nummulitic.¹

Flora
and
fauna.

An analysis of the flora of the county was placed before the British Association in 1872 by Mr W. B. Hemsley (*Report*, 1872, p. 125), who stated the total number of indigenous plants to be 1000, to which 59 introduced species must be added. The most interesting features of the flora are the number of species to the county, area, the species peculiar to certain formations, viz., the Chalk (56), maritime species (76), and the rare species, especially of the Atlantic and Scottish types. Amongst the rarer marsh plants are *Isandria palustris*, *Scirpus triquetus*, *S. carinatus*, *Pyrola media*, *Habenaria alba*, *Festuca sulcata* of the "Scottish" type of Watson, this last is not found in adjoining counties. A prominent feature of the Wealden flora is the extent of heath land and the large size the heath attains. The fauna includes 29 species of *Mammalia*. The birds are very numerous, no less than 291 species having been recorded. There are about 76 species of general migratory visitors. Of the 216 species of marine fishes found round the British coasts 106 have been observed off Sussex, and there are also 19 freshwater fish.²

Climate.

The county presents two distinct climates, that of the coast district being mild, equable, and dry, whilst that of the Wealden district is continental, extreme, and rainy. The coast rainfall is about 25 to 26 inches annually and that of the Weald about 33 inches, this is due partly to the South Downs, which rise up in the path of the rain-clouds, and partly to the large extent of forest. In the wet years of 1852 and 1872 the rainfall at several Wealden stations exceeded 50 inches. At Crowborough Beacon the average yearly rainfall from 1871 to 1884 was 38.16 inches, at Brighton during the same period it was only 28.87. Temperature in the Weald at Uckfield has ranged from 95° Fahr on 14th July to -4° on 20th January 1838. The mean daily range of temperature in the Weald is about half as much again as on the coast. The influence of the sea in modifying the temperature of the coast district is specially noticeable in the autumn months, when the temperature is higher than in the Weald and other parts of England northwards, and fashion has (perhaps unconsciously) selected the period from September to November for the Brighton season. Sea bathing, first introduced about the middle of the 18th century, together with the fresh pure air, has turned the stream of health-seekers from Bath and Tunbridge Wells and other watering places into Sussex. The poor but populous fishing-town of Brighthelmston developed into the fashionable town of Brighton, the new town of Worthing sprang up in Broadwater parish, and the fishing village of Eastbourne rose in importance. The Cinque Port town of Hastings afterwards developed its fashionable suburb St Leonards, and Seaford was also re-sorted to, in the western part of the county the hamlet of Bognor became a fashionable place. The opening of the

railway from London to Brighton in 1840, soon followed by coast lines from east to west, occasioned a great increase in the coast towns, and now almost the entire coast (except in its steep parts) presents a line of fashionable "health resorts" unequalled in any English county, these indeed form the special distinguishing feature of Sussex amongst other counties.

Sussex is divided into the six rapes³ of Hastings, Pevensey, Adur, Lewes, Bramber, Arundel, and Chichester. The only rapes which still exist for practical purposes are that of Hastings, which has a separate coroner, and the last three, in which the liability to repair bridges falls as of common right upon the rape instead of the county division. The Act 10 Hen VII cap 24 directed that for convenience the county court should be held at Lewes as well as at Chichester, and this apparently gave rise to the division of Sussex into east and west parts, and separate quarter sessions are now held for these two divisions. The boroughs of Hastings, Rye, Brighton, and the city of Chichester have separate commissions of the peace and courts of quarter sessions. There are eighteen petty and special sessions divisions. At the time of the Domesday survey the county contained 65 hundreds, but the modern total is 68. Of the 7 municipal boroughs which the county contains Arundel, Chichester, Hastings, and Rye existed long before the passing of the Municipal Corporations Act, 1835, Brighton was incorporated in 1854, Lewes in 1851, and Eastbourne in 1883. Winchelsea, Seaford, Pevensey, and Midhurst were unincorporated corporations existing under old charters, the first being governed by a mayor and the last three by bailiffs, but all their privileges have lately been abolished. "Sussex, as Mr Freeman observes, 'is no shire, no department, but a component element of England, older than England'." The diocese of Chichester is nearly coextensive with the county and the old kingdom of Sussex. In the year 681 the county was converted to Christianity by St Wilfrid (afterwards archbishop of York), who founded the see of Selsey, but in 1075 the see was transferred from Selsey to Chichester. The diocese consists of two archdeaconries, Lewes and Chichester, and five deaneries. There are 322 civil parishes, with parts of seven others.

Prior to the Reform Bill of 1832 Sussex returned twenty-eight Members to the House of Commons, two for the county and two for each of the boroughs of Arundel, Bramber, Chichester, East Grinstead, Hastings, Horsham, Lewes, Midhurst, New Shoreham (with several of the rape of Bramber), Rye, Seaford, Steyning, and Winchelsea. The borough of New Shoreham was in 1771 added to the rape of Bramber. In 1832 Bramber, East Grinstead, Seaford, Steyning, and Winchelsea were entirely disfranchised, the first named being classed with the worst of the "rotten" boroughs, Arundel, Horsham, Midhurst, and Rye were each deprived of one member, the county was divided into two parts (East and West), each returning two members, and a new borough, Brighton, was created, to which two members were allotted. Chichester and Lewes were each deprived of one member in 1867, and Arundel was disfranchised in 1869. The Redistribution of Seats Act, 1885, disfranchised Chichester, Horsham, Midhurst, New Shoreham (with the rape of Bramber), and Rye, and deprived Hastings of one member. It also divided the county into six (instead of two) divisions, viz. Lewes, Southern or Eastbourne, Eastern or Rye, South western or Chichester, Northern or East Grinstead, North western or Horsham, each returning one member. Brighton still retains two members.

According to the latest owners of land *Return* (1873), there were Land 11 proprietors with more than 10,000 acres each, 8 of 5000 to 10,000, owners 1015 of 100 and less than 5000, of 10 and less than 100 acres, 1677, of 1 and less than 10, 2347, and of less than an acre, 14,675 — making a grand total of 19,733 landowners — having a gross estimated rental of £2,418,522, there were in addition 23,788 acres of common or waste lands. The eleven principal landowners were — Lord Leconfield, 30,221 acres, the duke of Norfolk, 19,217, the duke of Richmond, 17,117, the earl of Chichester, 16,272, the marquis of Abercromby, 15,364, Rev John Goring, 14,130, the earl of Ashburnham, 14,051, the earl of Egmont, 14,021, Viscount Gage, 13,739, the Earl De la Warr, 11,185, and the duke of Devonshire, 11,062. At the time of the Domesday survey there were 15 tenants *in capite*, 534 under tenants, and 2497 *bordarii* (or cottagers), also 765 *colarii* (or cottars). The custom of borough English, by which land descends to the youngest son, prevailed to an extraordinary degree in Sussex, and no less than 140 manors have been catalogued in which it was found.⁴ Gavelkind tenure existed in Rye, in the large manor of Brede, and in Coustard manor (in Brede parish).

The coast district has been under cultivation from the time of Agricola the Romans and is very fertile, being specially suitable for market gardens and for growing fruit trees. The fig gardens of West Tarring are celebrated. Marshall,⁵ describing the Weald in 1788,

¹ Address to Geological Section of British Association, 1882.

² Good lists of fauna and flora of certain parts of the eastern division of the county have been published by the Hastings Literary and Philological Society and the Eastbourne Natural History Society.

³ Probably derived from the Icelandic *hreppr*, signifying land divided by a rope. It is first mentioned in the Domesday survey.

SUTHERLAND, a northern maritime county of Scotland, is bounded E by Caithness, S E by Moray Firth, S and S W by Ross and a part of Cromarty, and N and W by the Atlantic and the North Sea. The area is 1,297,846 acres, or nearly 2028 square miles. The northern and western shores are broken and irregular, in some cases deeply indented, and in the north west, at Cape Wrath, near Durness, at Whiten Head, and farther south at the island of Handa there are ranges of wildly precipitous cliffs. Numerous islands stud the larger inlets on this coast, the only ones inhabited in 1881 were Oldney with four persons and Roan (in Kyle of Tongue) with forty-three, Handa, which had eight inhabitants in 1871, had none in 1881. On the north coast the principal sea lochs are the Kyle of Tongue, Loch Erriboll, and the Kyle of Durness, and on the west coast Loch Inchard, Loch Laxford, the various branches of Eddrachillis Bay, and Loch Inver. The eastern shore is low and comparatively regular, the only inlets being Loch Fleet and Dornoch Firth. With the exception of the narrow plain along the east coast, various stretches of low ground on the west coast, and the low grounds adjoining the rivers and inland lochs, the surface consists chiefly of a succession of irregular elevations of from 500 to over 3000 feet in height. Much of the western district adjoining the coast from Cape Wrath southwards is occupied by Archaean gneiss, forming a series of bare rounded knolls. Resting unconformably on the gneiss are deposits of grits and sandstones, generally regarded as of Cambrian age, rising into wild cliffs between Cape Wrath and the Kyle of Durness. These are succeeded unconformably by Silurian strata, specially developed in the neighbourhood of Durness and Erriboll, in the former region they form a basin occupied chiefly by the limestone series, containing a remarkable collection of fossils, and at Erriboll, from which the strata at Durness are separated by a great dislocation, they present a remarkable series of horizontal displacements. Towards the east the gneiss is intermixed with granite and syenite, which cap the summits of a few of the mountains. Outliers of Old Red Sandstone also occur in this eastern mountainous region, sometimes in masses of coarse conglomerate. The highest mountain summit in Sutherland is Benmore Assynt (3273 feet), the culminating peak of a fine range of Silurian quartzites and limestone rocks lying to the south-east of Loch Assynt, while to the south-west are the picturesque conical summit of Canisp (2779 feet) and the curious Suiwen (2399 feet) with its forked top. The next highest and most picturesque series of mountain groups occurs in the north-eastern region, south of the Kyle of Tongue,—Ben Hope, a rounded mass with imposing precipices rising near Loch Hope to a height of 3040 feet, while to the eastward is the picturesque Ben Loyal or Laoghal (2504 feet), formed of granite, and south from it, near Loch Naver, the great bulk of Ben Klibreck (3154 feet). Numerous other summits attain a height of over 2000 feet, but the greater proportion of the mountainous region consists of elevated moorlands, bleak and uninteresting, except when the heather assumes its purple tints in autumn. In the lower region along the shores of Moray Firth the Old Red Sandstone occurs resting unconformably on the crystalline series of rocks, and is in turn succeeded by an interesting series of Jurassic strata, which, faulted against the older formations, are exposed along the coast from Golspie to Helmsdale. In this series, at Brora,

some seams of coal have been worked, but the presence of iron pyrites greatly lessens its value. Limestone is wrought in various districts, and there are a number of quarries for building stone. Small quantities of gold have been found in some places.

Sutherland has a much greater proportion of its area occupied by water than any other large county in Scotland, the parish of Assynt being completely honeycombed with lochs and tarns. Loch Assynt, the largest of these, 10 miles in length, and narrow and irregular in outline, is entitled to rank, from its picturesque creeks and the grandeur of the adjoining mountain scenery, as the most beautiful loch in Sutherland. Loch Shin, extending 17 miles throughout nearly the whole of Lairg parish, from south-east to north-west, is towards the centre overhung by mountain masses, but otherwise is without interest to any but the angler. It is succeeded northwards by a series of lochs,—Griam, Merkland, More, Stack, Garbadmore, Garbadbeg—extending through the centre of the parish of Eddrachillis. Lochs Merkland and Griam occur, like Loch Shin, in the course of the river Shin, a tributary of the Oykel, which last forms the southern boundary of the county with Ross and falls into Dornoch Firth. Lochs More and Stack are in the valley of the Laxford, running north-westward to Loch Laxford. The Dornard or Grudie flows northwards to the Kyle of Durness, and the Hope, after expanding into Loch Hope, about 10 miles in length, falls into Loch Erriboll. The Borgie, which in its course forms Loch Loyal and falls into Torrisdale Bay, the Naver, which flows from the loch of that name through a fertile strath to the sea at Bettyhill of Farr, the Strath, and the Halladale are the principal other rivers flowing northwards. Those entering Moray Firth are the Oykel, the Helmsdale, which reaches the sea at the town of that name, the Brora, which receives various tributaries before it expands into Loch Brora, 3 miles from its entrance into the sea at Brora, and the Fleet, flowing into Loch Fleet.

Agriculture—According to the agricultural returns of 1886 only 3110 acres out of 1,347,033 were in cultivation, less than a fortieth part of the whole area. The best land is that adjoining Moray Firth, where agriculture is in a very advanced condition. Along the river valleys there are, however, many fertile patches. At the beginning of the 19th century the crofters occupied almost every cultivable spot throughout the county, between 1811 and 1820 they were ejected from their holdings to the number of 15,000, and, according to the statement of Hugh Miller, "compressed into a wretched servage of poverty and suffering that fringes the county on its eastern and western shores." The homes they left were, he says, "improved into a desert", but in the opinion of those who made the alteration these mountainous parts were as "much calculated for the maintenance of stock as they were unfit for the habitation of man." The crofters in Sutherland are now (1887) chiefly confined to the western seaboard, the number of crofts, all on the estates of the duke of Sutherland, amounting, according to the *Report of the Crofters Commission*, to 1238, and representing a population of 6190. The general agricultural condition of the county has been much improved by successive dukes of Sutherland, aided by the liberality of the Government in the advancement of money for the construction of roads and bridges, and within recent years large reclamations have been made, in order to obtain a wider area for the growth of fodder and turnips. The following table gives the number and acreage of various classes of holdings in 1875, 1880, and 1885—

Year	50 acres and under		50 to 100 acres.		100 to 300 acres.		300 to 500 acres.		500 to 1000 ac.		Above 1000 ac.		Total	
	No.	Ac.	No.	Ac.	No.	Ac.	No.	Ac.	No.	Ac.	No.	Ac.	No.	Ac.
1875	2505	11,994	29	2069	42	6939	9	9576	4	2212			2,899	26,790
1880	2495	12,639	34	2541	40	6661	15	5730	5	2689			2,992	30,160
1885	2,112	13,282	44	3258	41	7899	14	6224	5	2899	2	80,000	2618	40,063

In 1885 of the class of holdings not exceeding 50 acres in extent 68 were between 20 and 50 acres each, 661 between 5 and 20, 1764 between 2 and 5, and 19 between $\frac{1}{2}$ and 1 acre.

Out of the 33,110 acres under tillage in 1886 there were 10,343 under corn crops, 5052 under green crops, 8861 rotation grasses,

\$602 permanent pasture, and 252 fallow. The principal corn crop is oats, which occupied 8392 acres, barley occupying 1545, rye 63, pulse 24, and wheat only 19. Potatoes occupied 204 acres and turnips and swedes 2981. Cattle, chiefly West Highland, short-horn, and cross-bred, numbered in 1886 12,806, of which 5576 were cows and heifers in milk or in calf, horses, which include a large number of ponies, although Clydesdales are used on the large farms, numbered 2667, of which 2015 were used solely for purposes of agriculture, sheep, the raising of which is the staple business of the county, the principal breed being Cheviots, numbered 211,825, of which 178,961 were two years old and above, and pigs, 1037. According to the *Report of the Crofters Commission*, there were four deer forests within the county, all belonging to the duke of Sutherland, viz., Ben Armin and Cair na-Slain, 37,840 acres, Dunrobin, 12,180, Glenmorris, 31,490, and Reiv, 64,600, in all 147,110 acres, or more than one ninth of the total area. There is a comparatively small area under woods,—only 12,260 acres in 1881.

According to the latest (1873) owners and heritages *Return* the land was divided among 43 proprietors possessing 1,297,253 acres at an annual value of £71,491, or 1s. 1½d. an acre all over. There were 318 proprietors who possessed each less than one acre, the total amount which they owned being only 59 acres. The bulk of the land is possessed by the duke of Sutherland, who owned 1,176,451 acres, the other proprietors possessing above 10,000 acres each being Sir Charles W. A. Ross, 55,000, L. C. Sutherland Walker, 20,000, Sir James Matheson, 15,490, and the executors of Gordon M. Leod 11,000. The total valued rental of the county in 1874 was only £27,193 Scots or £2266 sterling, while in 1885-86 it was £105,270.

Communication.—The county is well supplied with roads considering its mountainous character and its sparse population. Helmsdale affords the means of export for a considerable amount of farm produce. The Highland Railway enters the county at Inver-shin and after passing northwards to Lairg turns eastwards to the coast, which it skirts to Helmsdale, whence it turns north westwards along the banks of the Helmsdale, bending afterwards eastwards at Fornah into Cuthness.

Industries.—Various textile manufactures at one time established in the county have been discontinued, the only important manufacture now remaining being that of whisky at Clyne and Brora. Herring fishing prosecuted from Helmsdale is an important industry, and the cod, ling, and other deep sea fishings engage a large number of boats and men. There are valuable salmon fisheries in several of the rivers.

Administration and Population.—The county contains 13 entire parishes and part of the parish of Reay, the remainder being in Cuthness. The county returns one member to parliament, and one is returned for the Wick group of burghs. Dornoch, the only royal burgh, had but 497 inhabitants in 1881, while Golspie had 1548 and Helmsdale 794. The population has not varied greatly in numbers since the beginning of the 19th century. In 1801 the numbers were 23,117, and in 1881 they were 23,370, a gradual decrease having taken place since 1851, when the numbers reached 27,793. In 1881 there were 11,219 males and 12,151 females. Sutherland is the most sparsely peopled county in Scotland, there being only 12 persons to the square mile, while the average for Scotland is 12½. Sutherland forms a joint sheriffdom with Ross and Cromarty, and a sheriff substitute resides at Dornoch. Small debt circuit courts are held at Helmsdale, Tongue, Melnich and Seourie, and justice of peace courts at Dornoch, Golspie, Brora, and Helmsdale.

History and Antiquities.—The ancient Celtic inhabitants were almost entirely expelled by the Scandinavian settlers who occupied the county after its conquest by the Norse jarl Thorfinn in 1054. The remains of Pictish towers are numerous, as are also stone circles. Of other antiquities mention may be made of the walled fort on Dun Creich and of the extensive remains of Dun Dornachill in Dorness parish. After the conquest of the district by the Scottish kings, Sutherland was conferred on Hugh Freskin (a descendant of Freskin of Moravia or Moray), whose son William in 1223 was created earl of Sutherland by Alexander II. The nineteenth earl of Sutherland was created duke in 1833. The seat of the ancient episcopal see of Sutherland in Cuthness was at Dornoch, where a cathedral was erected by Gilbert of Moravia (1222-1245), of which the ancient tower, attached to the modern parish church, still remains.

See Sir Robert Gordon's *History of the Earldom of Sutherland* 1813, Hugh Miller's *Sutherland as it is* 1843, and C. W. G. St John's *Tour in Sutherland* 1849.

SUTTEE, the name given by English writers to the rite of burning a widow on the funeral pyre of her husband as practised among certain Hindu castes, and especially among the Rajputs. The word *sati* (as it should rather be written) properly denotes the wife who so sacrifices herself, not the rite itself, and means "a good woman," "a faithful wife." The sacrifice was not actually forced on a wife, but

it was strongly recommended by public opinion as a means to her own happiness and that of her husband in the future state, and the alternative was a life of degraded and miserable widowhood. The practice was current in India when the Macedonians first touched that country (Diod. Sic., vii. 33), and it lasted into the 19th century, having been tolerated even by English rulers till 1829. (See INDIA, vol. vii. p. 806.) The subject is illustrated by copious quotations from ancient and modern authorities in Yule's *Anglo-Indian Glossary*, p. 666 sq., and by comparison of similar rites among other nations in Tylor's *Primitive Culture*, ch. vi. It has its root in the primitive view of the future life, which regards the dead as having similar needs to the living. The wife is sent into the world of shades with her husband, just as arms, clothing, or treasure are buried in his tomb, or slaves are slain to attend their master in the underworld. The Indian custom is not, therefore, properly a part of Brahmanism, but it was adopted by the ministers of that religion, who strained their sacred texts to find support for it.

SUTTON COLDFIELD, an ancient market town and municipal borough of Warwickshire, England, is situated on the London and North-Western Railway, 8 miles south of Lichfield and 7 north east of Birmingham. The town has been greatly increased of late years by the erection of villas for persons having their business offices in Birmingham, Walsall, and other towns. The church of the Holy Trinity—Early English and Late Perpendicular, restored in 1874 and enlarged in 1879—contains a fine Norman font and the tomb of Bishop Vesey. He obtained from Henry VIII the grant of the park and manorial rights for the benefit of the town, the annual value (now about £2000) being expended in charities and education. On the picturesque park near the town, 2400 acres in extent, the inhabitants have the right of grazing horses and cattle at a small fee. A town-hall was erected in 1859, in it there is a good library. The corporation formerly consisted of a warden and 24 members, but in 1885 Sutton obtained a municipal charter by which it is divided into six wards, with an alderman and three councillors for each ward. The population of the township in 1871 was 5936, and in 1881 it was 7737.

Sutton was at one time a royal manor and an apurage of the earls of Warwick. It owes much of its prosperity to the gifts of John Vesey (Vossey), bishop of Exeter in the 16th century, who was a native of the place. In its charter of incorporation, 20th Henry VIII, it is called the royal town of Sutton Coldfield.

SUTTON-IN-ASHFIELD, a town of Nottinghamshire, England, is situated on an eminence on the Nottingham and Worksop and the Erewash Valley Railway, 3 miles west-south-west of Mansfield. The church of St Mary Magdalene of the 12th century was restored in 1868. In the churchyard is a yew tree reputed to be 700 years old. There are a number of collieries and lime-works in the vicinity. Cotton hosiery and thread are the principal manufactures. The duke of Portland is lord of the manor. The population of the urban sanitary district (area, 4855 acres) in 1871 was 7774, and in 1881 it was 8523.

SUWALKI, a government of Russian Poland, occupies the north-east corner of the kingdom, extending to the north between East Prussia and the Russian governments of Kovno, Vilna, and Grodno. Its area is 4846 square miles. It covers the east of the low swelling, studded with lakes, which skirts the south coast of the Baltic (see POLAND), its highest parts reaching 800 to 1000 feet above the sea. Its northern slopes descend to the valley of the lower Niemen, while in the south it falls away gently to the marshy tract of the Bebrz. The rivers flow there in deep gorges and valleys, diversifying the surface. Suwalki is watered by the Niemen, which forms its eastern and its northern boundary and is largely used as a channel of communication, it has many affluents from both slopes

of the swelling. The Augustowo Canal connects the navigable Hancza, tributary of the Niemen, with a tributary of the Bcbrz, which belongs to the basin of the Vistula, and an active traffic is carried on on this canal. The population was 606,573 in 1883, the increase being 3400 during the year. It has a most varied composition, embracing Lithuanians (the prevailing element), who number about four-tenths of the whole (Zhmuds, 31.5 per cent., Lithuanians proper, 10.3), Poles (28.4, of whom 5.3 are Mazurs), Jews (17.2), Germans (6.8, but they are rapidly increasing), and White Russians (4.6). In religion the Catholics are predominant (449,476 in 1883), the Jews come next (98,743), there are also 38,610 Protestants, 13,275 Orthodox Greeks, and 6246 Raskolniks.

Tertiary and Chalk deposits are widely spread in Suwałki, and the entire surface is covered with Post Tertiary deposits. The bottom moraine of the great ice sheet of North Germany, containing scratched boulders and furrowed by depressions having a direction north north east to south south west,¹ covers immense tracts of the ridge of the lake-districts and its slopes, while limited spaces are covered with well washed glacial sands and gravel. On the northern slopes of the coast ridge, the boulder clay being covered with lacustrine deposits, there are at many places layers of fertile soil, and in the southern parts of the province the boulder-clay is very stony, and sometimes covered with gravel. Still, nearly nine tenths of the surface are considered suitable for cultivation. Agriculture is the chief occupation, and potatoes are extensively grown for export to Prussia, where they are used for the manufacture of spirits, which are smuggled into the province. The manufactures are unimportant (600 workmen, annual produce valued at £124,000, one half being due to distilleries). All manufactured wares are imported, mostly from Prussia, and all trade is in the hands of Jews. The educational institutions include two gymnasia for boys, one for girls, one seminary for teachers (at Weiwery), one Catholic seminary and 196 lower grade schools, having altogether an aggregate of 13,193 scholars in 1884. Suwałki is divided into seven districts: the chief towns of which with their populations in 1882 were—SUWAŁKI (see below), Augustowo (11,100), Kalwarya (10,600), Mariampol (5610), Sejny (4035), Wilkowszki (6700), and Władysławow (9300). Wierzbolowo (3550), an important custom house, situated on the railway from St Petersburg to Berlin, also has municipal institutions.

SUWAŁKI, capital of the above government, is situated at the source of the Hancza, tributary of the Niemen, 75 miles north west of Grodno. In the 15th century it was but a small village, lost amidst forests, and peopled by Lithuanians. In the end of the 18th century it became the capital of the Augustowo government, but never had any importance, except as the seat of the local authorities. Since 1834 it has been the capital of the government of Suwałki. Its population was 18,640 in 1882.

SUWAROFF, or SUWOROFF, ALEXANDER VASILIEVICH (1729-1800), Russian general, was born at Moscow on 24th November 1729, the descendant of a Swede named Suvor who emigrated to Russia in 1622. Suwaroff entered the army at an early age and first distinguished himself at the battle of Kunersdorf in 1759, where he acted as aide-de-camp to General Fermor. Throughout the Seven Years' War he was conspicuous for his bravery and military skill. He next took part in the battles between the Russians and Poles at the period of the first dismemberment of Poland. Being afterwards transferred to the banks of the Danube (1773), he there in the campaigns against the Turks laid the foundation of his reputation as a military commander. In 1775 he put an end to the formidable revolt of Pugatcheff, who was brought in chains to Moscow and there decapitated. In 1789 Suwaroff defeated the Turks at Fokshani (Moldavia), and again in the same year on the Rymnik. In 1790 he took by assault the town of Ismail, on which occasion he sent his well known couplet to the empress. On the termination of this war Suwaroff was summoned to another campaign against the Poles. After the defeat of Kosciuszko at Macowice in Siedlice (1794) he marched on

Warsaw, and captured its suburb Praga, where 15,000 Poles were massacred. Upon this the city capitulated, and the Russian general was made field marshal. He remained in Poland till 1795 and was received in triumph on his return to St Petersburg. In November 1796 the empress Catherine, his firm friend and admirer, died. On the accession of Paul, who always laboured to undo his mother's work, Suwaroff fell into disgrace and was banished to his country-seat at Kontchanskoe in the government of Novgorod. There he remained some time in retirement. He unsparingly criticized the new military tactics and dress introduced by the emperor, and some of his caustic verses reached the ears of Paul. His conduct was therefore watched and his correspondence with his wife, who had remained at Moscow—for his marriage relations had not been happy—was tampered with. On Sundays he tolled the bell for church and sang among the rustics in the village choir. On week days he worked among them in a smock frock. But in February 1799 he was summoned by the emperor to assist in the campaign with the Austrians against the French. Suwaroff took command of the combined forces at Verona. He attacked Moreau, the French general, at Cassano, the ford of the Adda, and completely defeated him, taking about 3000 prisoners, he then made a triumphal entry into Milan. He next defeated Macdonald on the Trebbia in a sanguinary engagement which lasted three days, from the 17th to the 19th of June (1799). Soon afterwards Joubert was defeated and slain at Novi (15th August). But the importance of these successes was neutralized by the constant squabbles between Suwaroff and the Austrian commanders. The Russian general now received orders to join Korsakoff in Switzerland and to assist him in driving the French from that country. He accordingly crossed the Alps, suffering severe losses, but on his arrival learned that Korsakoff had been previously defeated by Massena. It only remained for him to effect a retreat with the shattered remains of his army. He finally reached his winter quarters, between the rivers Iller and Lech, and thence directed his homeward march to Russia. The emperor Paul, who soon after this time entirely changed his policy and made an alliance with Bonaparte, recalled Suwaroff in disgrace, and on his return refused to see him. The veteran retired to his country-seat, where he died on the 18th of May 1800. Lord Whitworth, the English ambassador, was the only person of distinction present at the funeral of this remarkable man. He lies buried in the church of the Annunciation in the Alexandro-Neviski monastery, the simple inscription on his grave being, according to his own direction, "Here lies Suwaroff."

Among the Russians the memory of Suwaroff is cherished as that of a great and successful general, but he hardly enjoys such a reputation among foreigners, who generally look upon his victories as due rather to the huge masses of men under his control than to military genius. His tactics seem to have been somewhat Oriental. He formed no general plans for his campaigns, but trusted to celerity of movement and blows rapidly struck. He was terribly reckless of human life, neither sparing his own soldiers nor showing mercy to the conquered. And yet we find him the subject of exaggerated eulogy among English writers in the early part of the 19th century. He was a man of great simplicity of manners, and while on a campaign lived as a common soldier, sleeping on straw and contenting himself with the humblest fare. But he had himself passed through all the gradations of military service, and had been for many years a private soldier, moreover, his education had been of the rudest kind. He affected the habits of a labourer, and his gibes provoked him many enemies. He had all the natural contempt of a man of ability and action for ignorant favourites and ornamental carpet knights. Droll stories, in keeping with the well known eccentricity of his character, are told of his manner of life in camp.

SVEABORG, an important fortress of Finland, built by Count Ehrensvärd in 1749 on seven small islands off the harbour of HELSINGFORS (q.v.). It is the seat of a great naval harbour and arsenal.

¹ Hebert, in *Proc. Rus. Geol. Committee*, iii, 1884.

SWABIA, SUABIA, or SUEVIA (Germ. *Schwaben*), is the name of an ancient duchy in the south-west part of Germany, afterwards transferred to one of the ten great circles into which the empire was divided in the reign of Maximilian I (1493-1519). At present the official use of the name is confined to a province of Bavaria (capital, Augsburg), comprising a mere fragment of the former Swabia, but in common use it is still applied to the districts included in the old duchy. The duchy of Swabia was bounded on the N by the Rhenish Palatinate, on the E by the Lech (separating it from the duchy of Bavaria), on the S by Switzerland, the Lake of Constance, and Vorarlberg, and on the W by the Rhine. It corresponds roughly to the modern Wurtemberg, Baden, and Hohenzollern, with part of Bavaria. The circle of Swabia coincided more nearly than most with the duchy from which it was named, but was rather more extensive. It was bounded by Switzerland, France (after the cession of Alsace), and the circles of the Upper and Lower Rhine, Franconia, Bavaria, and Austria. Its area was about 13,500 square miles. The Swabian circle contained more independent states of the empire than any other, including the countship (afterwards duchy) of Wurtemberg, the margraviate of Baden, the principalities of Hohenzollern and Lichtenstein, a whole series of smaller secular and ecclesiastical principalities, and upwards of thirty free imperial towns (Augsburg, Ulm, &c.). Swabia is intersected from west to east by the Danube, and is one of the most mountainous (Black Forest, Swabian Jura) and picturesque parts of the German empire. It is also very fertile. The Swabians are a strong, big framed, and good-humoured race, and, though in several popular legends the "Schwab" plays the part of a "wise man of Gotham," he is probably no denser than his neighbours.

The use of the name of Swabia in connexion with the south-west part of Germany, previously called Alemannia (see ALEMANNIA), begins with the 5th century of our era, when the Suevi poured into the country and amalgamated with the Alemanni. It was not, however, till the 8th century, when the dukedom of Alemannia was abolished and Rhetia and Alsace separated from it, that Swabia became the recognized name of the district, henceforth administered by nunci camere, as representatives of the Frankish emperors. One of these nunci, who usurped the ancient title of duke of Alemannia, was executed in 917, but two years later Henry I yielded to the popular will in allowing Count Burkhard I to style himself duke of Swabia. The dukedom thus founded, which lasted for more than three centuries, repeatedly changed hands, and was generally conferred by the emperors and kings of the Saxon and Franconian lines on members of their own families. In 1079 it passed into the hands of Frederick I of Hohenstaufen, the progenitor of a line of German monarchs, and under his successors Swabia had the reputation of being the most civilized and prosperous part of Germany. As, however, the Hohenstaufen line gradually lost strength in its hopeless struggle with the papacy, the Swabian nobles increased in power at the expense of the dukes, and several of them became "immediate." No duke of Swabia was appointed after the death of Conradin, the last of the Hohenstaufen, in 1268, and his place was henceforth filled in some degree by the count of Wurtemberg as *primus inter pares*. For the next 250 years or so the history of Swabia consists of an endless series of feuds between the different members of the dynasty, mingled with more or less abortive attempts of the German emperors and others to restore peace. The lesser nobles fought with the greater nobles, the towns banded themselves together against both, and alliances and counter alliances were formed and dissolved with bewildering rapidity. The "Schleglerkrieg" is the name given to a bloody contest between the counts of Wurtemberg and the lesser nobles in 1367. The most important of the various leagues formed by the towns was the "Schwabischer Städtebund" of 1376, the point of which was directed against Wurtemberg. In 1488 the Swabian estates,—nobles, prelates, and towns,—weary of constant dissension, joined in the Great Swabian Confederation, the object of which was to maintain peace throughout the country. This league possessed a carefully drawn up constitution and exercised executive and judicial functions throughout the whole of Swabia, maintaining a standing army to give force to its decrees. Though not successful in completely abolishing war within Swabia, the confederation was by no means a failure. It was, for instance, the general of the confederation that put an end to the calamitous Peasants' War of 1525. The Reformation found

ready acceptance in Swabia. Wurtemberg, Ulm, and some of the other estates even joined in the Schmalkald League, but for this they afterwards had to pay large fines to the emperor, while the towns lost their democratic constitution, and with it most of their political importance. The outstanding feature of Swabian history for some time afterwards may be said to be the struggle for supremacy between the Protestant Wurtemberg and the Roman Catholic Austria. In 1512, when all Germany was divided into ten circles, one of them was named the Schwabischer Kreis, or Swabian Circle (see above). The circle received its complete organization in 1563, and retained it practically unchanged till the dissolution of the empire in 1806. Swabia suffered severely in the Thirty Years' War, and it was also one of the scenes of the struggles consequent on the French Revolution. But its modern history must be sought for under such headings as WURTEMBERG and BADEN.

SWAHILI (*Wa-Swahili* i.e., "Coast People," from the Arabic *sāhil*, coast), a term now commonly applied to the inhabitants of Zanzibar and of the opposite mainland between the parallels of 2° and 9° S, who are subjects of the sultan of Zanzibar, and whose mother-tongue is the Ki-Swahili language. According to present local usage no person would be called a Swahili unless he verified these two conditions. The Swahili are essentially a mixed people, in whom the Bantu and Arab elements are mingled in the proportion of about three to one, and the same is true of their speech, which of all the Bantu dialects has been most affected by Arab and other influences. The interest attaching to the Swahili people, who have figured so largely in the history of African enterprise during the last half century, is thus of a social rather than of a strictly scientific character. The energy and intelligence derived from a large infusion of Semitic blood has enabled them to take a leading part in the development of trade and the industries, as shown in the wide diffusion of their language, which, like the Hindustani in India and the Guarani in South America, has become the principal medium of intercommunication throughout most of the continent south of the equator. During his journey from the Indian Ocean to the Atlantic Commander Cameron found that a knowledge of this language enabled him everywhere to dispense with the aid of an interpreter, as it was understood by one or more persons in all the tribes along the route. Owing to this circumstance the intelligent and enterprising natives of Zanzibar have been found indispensable assistants in every expedition penetrating from the eastern seaboard to the interior since they began to be employed by Speke and Burton as porters and escorts. Missionary enterprise has been at work amongst the Swahili, who are all Mohammedans, but with poor results. The language, however, has been carefully studied, and is now better known than perhaps any other member of the Bantu family. There are several varieties, of which the chief are—the archaic Ki-Ngozi in the north about the river Tana, mostly free from foreign elements, the Ki-Mvita of the Monibasa district, reduced to writing by Krapf, and the Maneno Unguya of Zanzibar, which is most affected by Arabic, Persian, Indian, and other foreign influences, but which, nevertheless, is now the literary standard, of it complete grammatical treatises have been published, and into it portions of the Bible have been translated by Bishop Steere.¹

SWALLOW (*A-S Swalewe*, Icel *Svala*, Dutch *Zwaluwe*, Germ. *Schwalbe*), the bird which of all others is recognized as the harbinger of summer in the northern hemisphere, for, though some slight differences, varying according to the meridian, are constantly presented by the birds which have their home in Europe, in northern Asia, and in North America respectively, it is difficult to allow to them a specific value, and consequently a zoologist of wide views,

¹ The language was first reduced to writing by the Arabs, who still use the Arabic character. But the European missionaries have wisely replaced this by the Roman system, which is far more suited for the transliteration of most African, and especially of the Bantu, tongues.

while not overlooking this local variation, will regard the Swallow of all these tracts as forming a single species, the *Hirundo rustica* of Linnaeus.¹ Returning, usually already paired, to its summer-haunts, after its winter-sojourn in southern lands, and generally reaching England about the first week in April, it at once repairs to its old quarters, nearly always around the abodes of men, and, about a month later, the site of the nest is chosen, resort being had in most cases to the very spot that has formerly served the same purpose—the old structure, if still remaining, being restored and refurnished. So trustful is the bird that it commonly establishes itself in any of men's works that will supply the necessary accommodation, and a shed, a barn, or any building with an open roof, a chimney² that affords a support for the nest, or even the room of an inhabited house—if chance should give free access thereto,—to say nothing of extraordinary positions, may be the place of its choice. Wheresoever placed, the nest is formed of small lumps of moist earth, which, carried to the spot in the bird's bill, are duly arranged and modelled, with the aid of short straws or slender sticks, into the required shape. This is generally that of a half saucer, but it varies according to the exigencies of the site. The materials dry quickly into a hard crust, which is lined with soft feathers, and therein are laid from four to six white eggs, blotched and speckled with grey and orange brown deepening into black. Two broods are usually reared in the season, and the young on leaving the nest soon make their way to some leafless bough, whence they try their powers of flight, at first accompanying their parents in short excursions on the wing, receiving from them the food themselves are as yet unable to capture, until able to shift for themselves. They collect in flocks, often of many hundreds, and finally leave the country about the end of August or early in September, to be followed, after a few weeks, by their progenitors. The Swallows of Europe doubtless pass into Africa far beyond the equator,³ and those of Northern Asia, though many stop in India or Burmah, even further to the southward, occasionally reaching Australia, while those of North America extend their winter wanderings to southern Brazil, but, whithersoever they then resort, they during that season moult their feathers, and this fact affords one of the strongest arguments against the popular belief (which, curious to say, is still partly if not fully entertained by many who should know better) of their becoming torpid in winter, for a state of torpidity would suspend all animal action.⁴ The chestnut forehead and throat, the shining steel blue upper plumage, and the dusky-white—in some cases reddening so as almost to vie with the frontal and gular patches—of the lower parts are well known to every person of observation, as is the markedly forked tail, which is become proverbial of this bird.

¹ Dr Stejneger (one of the chief leaders in the recent American movement, the results though not the intention of which would be the subversion of much of the nomenclature of birds hitherto thought in Europe to have been established on tolerably firm principles) would apply to the Swallow the generic term of *Chelidon*, generally accepted for the MARTIN (vol. xi p. 581), and to the latter *Hirundo*. Herein he is technically incorrect, for one of the first principles of zoological nomenclature has always been that a generic term, to be valid, must be defined. In the absence of definition such a term may be, by courtesy, occasionally accepted, but this courtesy has never been, nor except in America is likely to be, extended to the misapplication here in question.

² Hence the common English name of "Chimney Swallow." In North America it is usually the "Barn Swallow."

³ It must be noted that the Swallow has been observed in England in every month of the year, but its presence from the beginning of December to the middle of March is an extremely rare occurrence.

⁴ See John Hunter's *Essays and Observations in Natural History*, edited by Sir R. Owen in 1861 (ii. p. 280). An excellent bibliography of the Swallow torpidity controversy, up to 1878, is given by Prof. Cones (*Birds of the Colorado Valley*, pp. 378-390), who seems still to hanker after the ancient faith in "hibernation."

Taking the word Swallow in a more extended sense, it is used for all the members of the Family *Hirundinidae*,⁵ excepting a few to which the name MARTIN (vol. xv p. 581) has been applied, and this Family includes from 50 to 100 species, which have been placed in many different genera. The true Swallow has very many allies, some of which range almost as widely as itself does, while others seem to have curiously restricted limits, and much the same may be said of several of its more distant relatives. But altogether the Family forms one of the most circumscribed and therefore one of the most natural groups of *Oscines*, having no near allies, for, though in outward appearance and in some habits the Swallows bear a considerable resemblance to SWIFTS (q. v.) the latter belong to a very different Order, and are not *Passerine* birds at all, as their structure, both internal and external, proves. It has been sometimes stated that the *Hirundinidae* have their nearest relations in the *Falconidae* (vol. ix p. 351), but the assertion is very questionable, and the supposition that they are allied to the *Amphisp. (cf. W. & W. 1)*, though possibly better founded, has not as yet been confirmed by any anatomical investigation. An affinity to the Indian and Australian *Ardea* is (the species of which genus are often known as Wood Swallows or Swallow Shrikes) has also been suggested, and it may turn out that this genus with its neighbours may be the direct and less modified descendants of a generalized type, whence the *Hirundinidae* have diverged, but at present it would seem as if the suggestion originated only in the similarity of certain habits, such as swift flight and the capacity of uninterruptedly taking and swallowing insect food on the wing.

Swallows are nearly cosmopolitan birds, inhabiting every considerable country except New Zealand, wherein only a stray example, presumably from Australia, occasionally occurs. (v. s.)

SWAMMERDAM, JOHN (1637-1680), may be ranked almost with Leeuwenhoek as one of the most eminent Dutch naturalists of the 17th century. Born at Amsterdam in 1637, the son of an apothecary and naturalist, he was destined for the church, but he insisted on passing over to the profession of medicine, meanwhile passionately devoting himself to the study of insects. Having necessarily to interest himself in human anatomy, he devoted much attention to the preservation and better demonstration of the various structures, and he devised the method of studying the circulatory system by means of injections, so doing the greatest service to practical anatomy. The fame of his collection soon became European, thus the grand duke of Tuscany offered him 12,000 florins for his collection, on condition of his coming to Florence to continue it. His *General History of Insects* and other kindred works lie at the foundation of modern entomology, and include many important discoveries. Thus he cleared up the subject of the metamorphosis of insects, and in this and other ways laid the beginnings of their natural classification, while his researches on the anatomy of mayflies and bees were also of fundamental importance. His devotion to science led to his neglect of practice, his father greatly resented this, and stopped all supplies, and thus Swammerdam experienced a period of considerable privation, which had the most unfortunate consequences to his health, both bodily and mental. In 1675 he published his *History of the Ephemera*, and in the same year his father died, leaving him an adequate fortune, but the mischief was irreparable. He became a hypochondriac and mystic, joined the followers of Antonette Bourignon, and died at Amsterdam in 1680.

SWAN (A-S *Svan* and *Sicon*, Icel *Staur*, Dutch *Zwaan*, Germ *Schwan*), a large swimming bird, well known from being kept in a half domesticated condition throughout many parts of Europe, whence it has been carried to

⁵ An enormous amount of labour has been bestowed upon the *Hirundinidae* by Mr Sharpe (*Cat. B. Br. Museum*, v. pp. 85-210), only commensurate, perhaps, with that required for an understanding of the results at which he has arrived. Nothing can better show the difficulty of unravelling the many puzzles which the Family offers than this, and it is to be hoped that in his finely illustrated *Monograph* which is now in course of publication he will succeed in clearing up some of them.

other countries. In England it was far more abundant formerly than at present, the young, or Cygnets,¹ being highly esteemed for the table, and it was under especial enactments for its preservation, and regarded as a "Bird Royal" that no subject could possess without licence from the crown, the granting of which licence was accompanied by the condition that every bird in a "game" (to use the old legal term) of Swans should bear a distinguishing mark of ownership (*cygninota*) on the bill. Originally this privilege was conferred on the larger freeholders only, but it was gradually extended, so that in the reign of Elizabeth upwards of 900 distinct Swan-marks, being those of private persons or corporations, were recognized by the royal Swanherd, whose jurisdiction extended over the whole kingdom. It is impossible here to enter into further details on this subject, interesting as it is from various points of view.² It is enough to remark that all the legal protection afforded to the Swan points out that it was not indigenous to the British Islands, and indeed it is stated (though on uncertain authority) to have been introduced to England in the reign of Richard Cœur de Lion, but it is now so perfectly naturalized that birds having the full power of flight remain in the country. There is no evidence to shew that its numbers are ever increased by immigration from abroad, though it is known to breed as a wild bird not further from our shores than the extreme south of Sweden and possibly in Denmark, whence it may be traced, but with considerable vacuities, in a south-easterly direction to the valley of the Danube and the western part of Central Asia. In Europe, however, no definite limits can be assigned for its natural range, since birds more or less reclaimed and at liberty consort with those that are truly wild, and either induce them to settle in localities beyond its boundary, or of themselves occupy such localities, so that no difference is observable between them and their untamed brethren. From its breeding-grounds, whether they be in Turkestan, in south eastern Europe, or Scania, the Swan migrates southward towards winter, and at that season may be found in north-western India (though rarely), in Egypt, and on the shores of the Mediterranean.

The Swan just spoken of is by some naturalists named the Mute or Tame Swan, to distinguish it from one to be presently mentioned, but it is the Swan simply of the English language and literature. Scientifically it is usually known as *Cygnus olor* or *C. mansuetus*. It needs little description: its large size, its spotless white plumage, its red bill, surmounted by a black knob (technically the "berry") larger in the male than in the female, its black legs and stately appearance on the water are familiar, other from figures innumerable or from direct observation, to almost every one. When left to itself its nest is a large mass of aquatic plants, often piled to the height of a couple of feet and possibly some six feet in diameter. In the midst of this is a hollow which contains the eggs, generally from five to nine in number, of a greyish olive colour. The period

of incubation is between five and six weeks, and the young when hatched are clothed in sooty-grey down, which is succeeded by feathers of dark sooty brown. This suit is gradually replaced by white, but the young birds are more than a twelvemonth old before they lose all trace of colouring and become wholly white.

It was, however, noticed by Plot (*N. II. Staffordshire*, p. 228) 200 years and more ago that certain Swans on the Trent had white Cygnets, and it was subsequently observed of such birds that both parents and progeny had legs of a paler colour, while the young had not the "blue bill" of ordinary Swans at the same age that has in some parts of the country given them a name, besides offering a few other minor differences. These being examined by Yarrell led him to announce (*Proc. Zool. Society*, 1838, p. 19) the birds presenting them as forming a distinct species, *C. immutabilis*, to which the English name of "Polish" Swan had already been attached by the London poulterers.³ There is no question so far as to the facts, the doubt exists as to their bearing in regard to the validity of the so called "species." Though apparently wild birds, answering fairly to the description, occasionally occur in hard winters in Britain and some parts of the European Continent,⁴ their mother country has not yet been ascertained,—for the epithet "Polish" is but fanciful,—and most of the information respecting them is derived only from reclaimed examples, which are by no means common. Those examined by Yarrell are said to have been distinctly smaller than common Swans, but those recognized of late years are as distinctly larger. The matter requires much more investigation, and it may be remarked that occasionally Swans, so far as is known of the ordinary stock, will produce one or more Cygnets differing from the rest of the brood exactly in the characters which have been assigned to the so called Polish Swans as specific—namely, their white plumage slightly tinged with buff, their pale legs, and flesh coloured bill. It may be that here we have a case of far greater interest than the mere question of specific distinction,⁵ in some degree analogous, but yet in an opposite direction, to that of the so called *Pavo nagripennis* before mentioned (PFAFFEN, vol. viii. p. 443).

Thus much having been said of the bird which is nowadays commonly called Swan, and of its allied form, we must turn to other species, and first to one that anciently must have been the exclusive bearer in England of the name. This is the Whooper, *Wastling*, or Wild Swan⁶ of modern usage, the *Cygnus musicus* or *C. ferus* of most authors, which was doubtless always a winter visitant to this country, and, though nearly as bulky and quite as purely white in its adult plumage, is at once recognizable from the species which has been half domesticated by its wholly different but equally graceful carriage, and its bill—which is black at the tip and lemon-yellow for a great part of its base. This entirely distinct species is a native of Iceland, eastern Lapland, and northern Russia, whence it wanders southward in autumn, and the musical tones it utters (contrasting with the silence that has caused its relative to be often called the Mute Swan) have been celebrated from the time of Homer to our own. Otherwise in a general way there is little difference between the habits of the two, and very closely allied to the Whooper is a much smaller species, with very well marked characteristics, known as Bewick's Swan, *C. bewicki*. This was first indicated as a variety of the last by Pallas, but its specific validity is now fully established. Apart from size, it may be externally distinguished from the Whooper by the bill having only a small patch of yellow, which inclines to an orange rather than a lemon tint, while internally the difference of the vocal organs is well marked, and its cry, though melodious enough, is unlike. It has a more easterly home in the north than the Whooper, but in winter not unfrequently occurs in Britain.

Both the species last mentioned have their representatives in North America, and in each case the trans Atlantic bird is considerably larger than that of the Old World. The first is the Trumpetor Swan, *C. buccinator*, which has the bill wholly black, and the second the *C. columbianus* or *americanus*⁷—greatly resem-

¹ Here, as in so many other cases, we have what may be called the "table name" of an animal derived from the Norman French, while that which it bore when alive was of Teutonic origin.

² At the present time the Queen and the Companies of Dyers and Vintners still maintain their Swans on the Thames, and a yearly expedition is made in the month of August to take up the young birds—thence called "Swan upping" and corruptly "Swan hopping"—and mark them. The largest Swannery in England, indeed the only one worthy of the name, is that belonging to Lord Rochester, on the water called the Fleet, lying inside the Chesil Bank on the coast of Dorset, where from 700 to double that number of birds may be kept—a stock doubtless too great for the area, but very small when compared with the numbers that used to be retained on various rivers in the country. The Swanpits at Norwich seems to be the only place now existing for fattening the Cygnets for the table—an expensive process, but one fully appreciated by those who have tasted the results. The English Swan laws and regulations have been carefully but admirably treated by the late Sergeant Manning (*Penny Cyclopædia*, xxiii. pp. 271, 272), and the subject of Swan marks, elucidated by unpublished materials in the British Museum and other libraries, is one of which a compendious account, from an antiquarian and historical point of view, would be very desirable.

³ M. Gerbe, in his edition of Degland's *Ornithologie Européenne* (ii. p. 477), makes the amusing mistake of attributing this name to the "*fourreus*" (furriers) of London, and of reading it "*Cygne du pôle*" (polar, and not Polish, Swan).

⁴ Chiefly in the north-west, but Lord Lilford has recorded (*Ibid.*, 1860, p. 351) his having met with them in Corfu and Cyprus.

⁵ The most recent authorities on the Polish Swan are Stevenson, in separately printed advance sheets (1871) of his *Birds of Norfolk* (vol. iii.), and Southwell (*Trans. Norfolk & Norwich Nat. Society*, ii. pp. 258-260), as well, of course, as Dresser (*B. Europe*, vi. pp. 429-433, pl. 419, figs. 1, 2).

⁶ In some districts it is called by wild fowlers "Elk," which perhaps may be cognate with the Icelandic *Alfi* and the Old German *Ellis* or *Elps* (cf. Geener, *Ornithologia*, pp. 358, 359), though by modern Germans *Libschikan* seems to be used for the preceding species.

⁷ Examples of both these species have been recorded as occurring in Britain, and there can be little doubt that the first has made its way hither. Concerning the second more precise details are required.

hling Bewick's Swan, but with the coloured patches on the bill of less extent and deepening almost into scarlet. South America produces two very distinct birds commonly regarded as Swans,—the Black-necked Swan and that which is called *Cascaroba* or *Coscoroba*. This last, which inhabits the southern extremity of the continent to Chili and the Argentine territory, and visits the Falkland Islands, is the smallest species known,—pure white in colour except the tip of its primaries, but having a red hull and red feet.¹ The former, *C. melanocorypha* or *nigricollis*, if not discovered by earlier navigators, was observed by Narbrough 2d August 1670 in the Strait of Magellan, as announced in 1694 in the first edition of his *Voyage* (p. 52). It was subsequently found on the Falkland Islands during the French settlement there in 1764-65, as stated by Permetty (*Voyage*, ed. 2, ii. pp. 26, 99), and was first technically described in 1782 by Molina (*Saggio sulla Stor. Nat. del Chile*, pp. 234, 344). Its range seems to be much the same as that of the *Cascaroba*, except that it comes further to the northward, to the coast of southern Brazil on the east, and perhaps into Bolivia on the west. It is a very handsome bird, of large size, with a bright red nasal knob, a black neck, and the rest of its plumage pure white. It has been introduced into Europe, and breeds freely in confinement.

A greater interest than attaches to the South American birds last mentioned is that which invests the Black Swan of Australia. Considered for so many centuries to be an impossibility, the knowledge of its existence seems to have impressed (more perhaps than anything else) the popular mind with the notion of the extreme divergence—not to say the contrariety—of the organic products of that country. By a singular stroke of fortune we are able to name the precise day on which this unexpected discovery was made. The Dutch navigator Willem de Vlaming, visiting the west coast of Zuidland (Southland), sent two of his boats on the 6th of January 1697 to explore an estuary he had found. There their crews saw at first two and then more Black Swans, of which they caught four, taking two of them alive to Batavia, and Valentyn, who several years later recounted this voyage, gives in his work² a plate representing the ship, boats, and birds, at the mouth of what is now known from this circumstance as Swan River, the most important stream of the thriving colony of West Australia, which has adopted this very bird as its armorial symbol. Valentyn, however, was not the first to publish this interesting discovery. News of it soon reached Amsterdam, and the burgo-master of that city, Witsen by name, himself a fellow of the Royal Society, lost no time in communicating the chief facts ascertained, and among them the finding of the Black Swans, to Martin Lister, by whom they were laid before that society in October 1698, and printed in its *Philosophical Transactions* (xx p. 361). Subsequent voyagers, Cook and others, found that the range of the species extended over the greater part of Australia, in many districts of which it was abundant. It has since rapidly decreased in numbers, and will most likely soon cease to exist as a wild bird, but its singular and ornamental appearance will probably preserve it as a modified captive in most civilized countries, and perhaps even now there are more Black Swans in a reclaimed condition in other lands than are at large in their mother country. The species scarcely needs description: the sooty black of its general plumage is relieved by the snowy white of its flight feathers and its coral-like bill banded with ivory.

The *Cygninae* admittedly form a well-defined group of the Family *Anatidae*, and there is now no doubt as to its limits, except in the case of the *Cascaroba* above mentioned. This bird would seem to be, as is so often found in members of the South-American fauna, a more generalized form, presenting several characteristics of the *Anatinae*, while the rest, even its Black-necked compatriot and the almost wholly Black Swan of Australia, have a higher morphological rank. Excluding from consideration the little-known *C. davidi*, of the five or six³ species of the

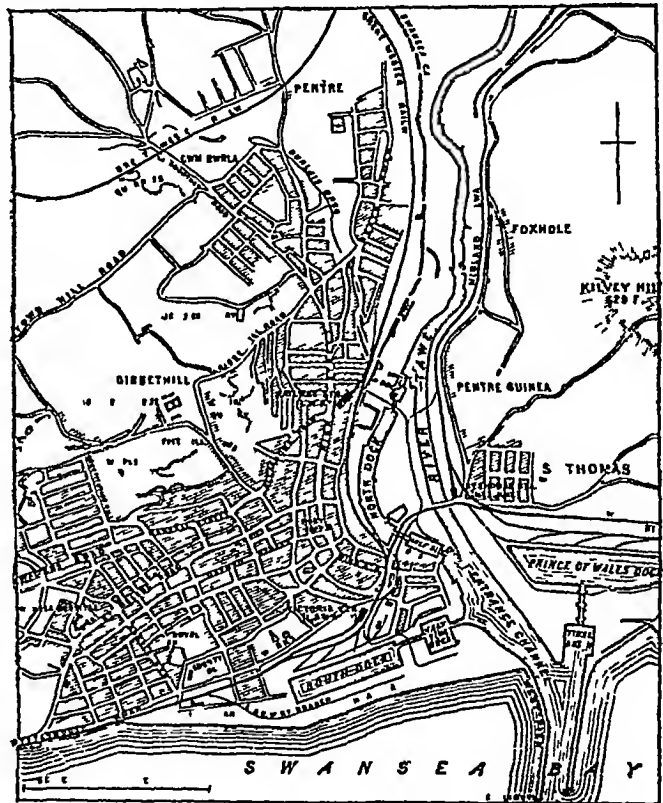

¹ Dr Stejneger (*Proc. U. S. Nat. Museum*, 1882, pp. 177-179) has been at such pains to show that this is no Swan at all, but merely a large Anatine form. Further research may prove that his views are well founded, and that this, with another very imperfectly known species, *C. davidi*, described by Swinhoe (*Proc. Zool. Society*, 1870 p. 430) from a single specimen in the Museum of Peking, should be removed from the Sub-Family *Cygninae*. Of *C. coscoroba* Mr Gibson remarks (*Ibis*, 1880, pp. 36, 37) that its "note is a loud trumpet call," and that it swims with "the neck curved and the wings raised after the true Swan model."

² Commonly quoted as *Oud en Nieuw Oost Indien* (Amsterdam, 1726). The incidents of the voyage are related in Decl. iii. Hoofdst. 11 (which has for its title Description of Banda) pp. 68-71.

³ The *C. uncinus* doubtfully described by Mr Hume (*Ibis*, 1871, pp. 412, 413) from India, though recognized by Dr Stejneger (*ut supra*), seems to be only the immature of the Mute Swan.

Northern hemisphere four present the curious character, somewhat analogous to that found in certain CRANES (vol. vi p. 546), of the penetration of the sternum by the trachea nearly to the posterior end of the keel, whence it returns forward and upward again to revert and enter the lungs, but in the two larger of these species, when adult, the loop of the trachea between the walls of the keel takes a vertical direction, while in the two smaller the bend is horizontal, thus affording an easy mode of recognizing the respective species of each.⁴ Fossil remains of more than one species of Swan have been found. The most remarkable is *C. falconeri*, which was nearly a third larger than the Mute Swan, and was described from a Maltese cave by Prof. Parker in the *Zoological Transactions* (vi pp. 119-124, pl. 30). (A. N.)

SWANSEA, a municipal and parliamentary borough and large seaport of Glamorganshire, South Wales, is finely situated in an angle between lofty hills, on the river Tawe,

Plan of Swansea.

near its mouth in the beautiful Swansea Bay, a recess of the Bristol Channel, and on the Great Western, London and North-Western, Midland, and Rhondda and Swansea Bay railway lines, 45 miles west-north-west of Cardiff. Being for the most part of comparatively modern growth, the streets are laid out with great regularity. Swansea retains few traces of antiquity, and some of its more picturesque features have been destroyed to make room for the construction of docks. Of the old castle,

⁴ The correct scientific nomenclature of the Swans is a matter that offers many difficulties, but they are of a kind far too technical to have any interest for the general reader. Dr Stejneger, in his learned "Outlines of a Monograph" of the group (*ut supra*), has employed much research on the subject, with the result (which can only be deemed unhappy) of upsetting nearly all other views hitherto existing, and propounding some which few ornithologists outside of his adopted country are likely to accept, since the principles on which he has gone are not those commonly received, nor (it may perhaps be added) are based on common sense. In the text, as above written, care has been taken to use names which will cause little if any misunderstanding, and this probably is all that can be said in the present state of confusion.

originally founded in 1099 by Henry Beauchamp, earl of Warwick, to secure possession of his lands in the province of Gower, the principal remains are the keep, built by Bishop Gower of St David's after the castle had been for some time in ruins, a range of arched dungeons lit by loopholes, and the hall, now fitted up for use as a volunteer drill hall. There are fragments of a wall with a Gothic window of the hospital of St David, founded by Bishop Gower in 1331. The church of St Mary's, founded by the same bishop, was rebuilt in 1739, with the exception of the tower and chancel. The modern public buildings include the guildhall, in the Italian style with Corinthian pillars and pilasters, erected in 1846, and comprehending the municipal offices, the crown and *maior* courts, the council chamber, and the library of the Swansea and Neath Incorporated Law Society, the royal institution of South Wales, established 1835, a building in the Ionic style, and embracing a library, a lecture hall, and a museum of geology, mineralogy, natural history, and antiquities, the free public library, schools of art, and art gallery, a fine new building with about 30,000 volumes (including the library of the Rev Rowland Williams, one of the authors of *Essays and Reviews*) and a large number of beautiful engravings, the grammar school, founded by Hugh Gore, bishop of Waterford, in 1682, the market (1830), the cattle market (1864), the Albert hall for concerts (1864), with a smaller hall erected in 1881, the agricultural hall, the working men's club (1875), the Prince of Wales hall (1882), and two theatres. The benevolent institutions include the general hospital, founded in 1817, and rebuilt with the addition of two wings in 1878, the Cambrian institution for the deaf and dumb, founded in 1847, and several times extended, the Swansea and South Wales institute for the blind (1865), the nursing institution (1853), the provident dispensary (1876), the eye hospital (1878), the industrial home (1859), and the sailors' home (1864). Swansea is specially well supplied with parks and recreation grounds. They include Brynmill grounds between Parkwern and Singleton (1872), 9 acres in extent, and containing a beautiful reservoir and ornamental lawns, Cwmdonkin park, on the uplands, 13 acres, and commanding fine views, the new recreation ground, formed in 1883, 11 acres, situated between Brynmill and the Oystermouth road, Park Llewelyn, to the north of Swansea, 40 acres, and the St Helen's Field, near the beach, about 20 acres, now being laid out. The population of the municipal borough (area 4363 acres) in 1871 was 51,702, and in 1881 it was 65,597. The population of the parliamentary borough in 1881 was 73,971. Its area then was 4777 acres, but in 1885, when Swansea received independent representation, the area was diminished, the population of this smaller area being 50,043 in 1881.

Swansea owes its prosperity to its situation in the neighbourhood of extensive collieries and to its possession of great natural advantages as a harbour. With some exaggeration it has been called the "metallurgical centre of the world," but the title must at least be allowed in reference to copper, which is imported to be smelted from all parts of the world. The smelting of copper which has been carried on in the district from the time of Elizabeth, is the distinctive and most important industry of the town, the others including tinplate manufacture, lead smelting, spelter and zinc manufacture, the extraction and manufacture of silver, nickel, and cobalt, iron smelting, Siemens steel manufacture, the manufacture of chemicals, of agricultural manure, and of patent fuel, and the construction of railway carriages and waggons. In Swansea Bay there are valuable oyster fisheries. The earliest harbour works on a large scale were those of the South Dock Company, begun in 1847 and opened in 1859. This dock, which has an area of about 13 acres, with a half tide basin of 4 acres and a lock 300 feet long by 60 feet wide, is used principally for the export of coal. The north dock, completed in 1882, has an area of about 10½ acres in addition to several other smaller docks. An important addition was made by the completion of the Prince of Wales Dock in October 1881, with an area of 23 acres, and as yet this additional accommo-

dation is more than sufficient for the trade of the port. In 1876 the number of sailing and steam vessels that entered with cargoes and in ballast from foreign countries, British possessions, and coastwise was 7799, of 1,068,062 tons, the number that cleared being 7549, of 1,041,078 tons. In 1885 the entrances were 7447, of 1,461,248 tons, the clearances 7051, of 1,366,117 tons. The total average value of the imports of foreign and colonial produce during the five years ending 1885 was about £2,400,000, but has been decreasing, and the total average value of the exports of the produce of the United Kingdom was about £1,500,000, but has been steadily increasing, and has reached over £2,000,000. There is a large trade with France, Portugal, Spain, and the Mediterranean ports. There is also considerable trade with South Africa, and the trade is greater with South than with North America. The exports consist chiefly of the various manufactures of the town, especially tin plates, the direct trade in which between Swansea and American ports has within the last two years attained great importance, and the imports include chiefly metallic ores, timber, and various kind of provisions. Shipbuilding and ship repairing are carried on, but the industry is of minor importance.

Swansea owes its origin to the erection of the castle in 1099 by Henry Beauchamp, earl of Warwick, who introduced into it a garrison of English and Flemish colonists. The fortress was frequently assaulted in the 12th and 13th centuries, and in 1260 was burned down by Llewelyn ab Gruffydd, last prince of North Wales. During the insurrection of Owen Glendower against Henry IV it was again destroyed. Swansea was created a borough by a charter of King John, which is said to be preserved among the records of the Tower of London. The earliest charter in possession of the corporation is that granted by Henry III in 1234, conferring upon it freedom from toll pontage and other customs. Its privileges were confirmed by Edward II and Edward III. The town was during the Civil War alternately in the hands of both parties, but in 1647 the castle was dismantled by the Parliamentarians, after which Oliver Cromwell was made lord of Swansea, of the signiory of Gower, and of the manor of Kellay. The corporation now consists of a mayor, 6 aldermen, and 18 councillors, and the borough has a commission of the peace. From the reign of Henry VIII it contributed along with other boroughs to return a member to parliament. In 1658 it received a charter from Cromwell permitting it to return a member for itself, but after the Restoration it resumed its character as contributor. In 1832 it became the head of a new district of boroughs, and in 1885 it received separate representation, while a portion of its area was also included in a district of boroughs to which it gives the name. In the reign of Edward IV the castle came by marriage to the Somerset family, and it is held by the duke of Beaufort, whose title of Baron Herbert of Gower dates from 1506.

SWARTZ, OLOF (1760-1818) a celebrated Swedish botanist, was born in 1760. He commenced his botanical studies in Upsala, under Linnæus and Thunberg, and began early to make excursions. He made a voyage to America in 1783, visited England in 1788, returned to Sweden in 1789, and was made professor of natural history in Stockholm. He was the author of many systematic works, and largely extended our knowledge of both flowering plants and cryptogams. He died in 1818.

See Sachs, *Geschichte d. Botanik*.

SWATOW (also, less frequently, SWARTOW and SHANTOW), a port of China, in the province of Kwang tung, opened to foreign trade in 1869. It is situated at the mouth of the main branch of the river Han, which 30 miles inland flows past the great city of Chow chu or Tai-chu (Tie-chu), and the surrounding country is more populous and full of towns and villages than any other part of the province. English merchants settled on Double Island in the river as early as 1856, but the city, which is built on ground but recently recovered from the sea, was formerly a mere fishing village. The trade of the port has rapidly increased. In 1869 718 vessels of all nations entered or cleared (of 310,500 tons burden), in 1884 1387 vessels (1,282,936 tons)—the total value of the trade being respectively £4,800,000 and £5,519,772. The surrounding country is a great sugar cane district producing annually about 2,000,000 piculs (= 133½ lb) of sugar, and there is an extensive refinery in the town employing upwards of 600 workmen and possessing a reservoir for 7,000,000 gallons of water. Next in value comes the manufacture of bean-cake, which is also imported in large quanti-

ties from Newchwang, Chefoo, Shanghai, Amoy, and Hong Kong (total import in 1874, 1,408,384 piculs, in 1884, 2,039,710). Among the leading exports are tea (since about 1872), grass cloth, manufactured at Swatow from so-called Taiwan hemp (the fibre of the *Bahmeria nivea* from Formosa), pine-needle cloth, manufactured in the villages about Kichlan (a town 22 miles distant), oranges, for which the district is famous, cheap fans, and pewter, iron, and tin ware. Swatow is also a great emigration port. In 1870 about 22,000 Chinese embarked there for Singapore, Bangkok, and Saigon, and the number of emigrants has since increased so that British vessels alone carry 10,000 to 13,000 per annum. Of the whole foreign trade of the port upwards of 83 per cent is in British bottoms, the trade with Hong Kong being of especial importance. The population of Swatow is upwards of 30,000. In 1871 the foreign residents numbered 147 (63 British), including Double Island.

About 1865 the whole Swatow district was still divided into a number of "independent townships, each ruled by its own head man" and the population was described in the official gazetteer as "generally rebellious and wicked in the highest degree." Mr. Forrester, British consular agent, relates that in that year he was witness to the preparations for a fight between the people living on the opposite sides of the estuary, which was only prevented by a single war vessel. The Taipings swept over the country, and by their ravages and plundering did much to tame the independence of the clans. The punishment inflicted in 1869 by Commander Fong, on the inhabitants of Otungpei (Ou ting pei), about 8 miles from Swatow, for the attack they had made on the boats of H. M. S. "Coehlförster," showed the Chinese authorities that such piratical villages were not so strong as had been supposed. General Fang (a native of Chow-chu-fu) was sent to reduce the district to order, and he carried out his instructions with remorseless rigour.

SWLAT. See NUTRITION, vol. xvi p. 685.

SWEATING SICKNESS. A remarkable form of disease, not known in England before, attracted attention at the very beginning of the reign of Henry VII. It was known indeed a few days after the landing of Henry at Milford Haven on August 7, 1485, as there is clear evidence of its being spoken of before the battle of Bosworth on August 22. Soon after the arrival of Henry in London on August 28 it broke out in the capital, and caused great mortality. Two lord mayors successively and six aldermen, beside numerous other persons, died in one week. At the end of October, however, the epidemic in London suddenly ceased. In Oxford it had already begun at the end of August, and lasted with great mortality for six weeks. In the course of the autumn it attacked various places, and by the end of December had spread over all England. Then the epidemic disappeared as suddenly as it came. This alarming malady soon became known as sweating sickness. It was regarded as being quite distinct from the plague, the pestilential fever, or other previously known, not only by the special name which gave it its name, but also by its extremely fatal course and by other characters to be noted.

Nothing more was heard of it till 1507, when it again occurred, which was much less fatal (it is said because the treatment was not attended less notice). In 1517 was another severe epidemic. It began in London and till the middle of December had spread to the king, Lord Clinton, and the king's secretary, the king's secretary, and also very fatal, on every half the king. There is evidence and Antwerp, but in England.

In the fourth time, and

with great severity. It first showed itself in London at the end of May, and speedily spread over the whole of England, though not into Scotland or Ireland. In London the mortality was very great, the court was broken up, and Henry VIII. left London, frequently changing his residence. When the epidemic ceased cannot be accurately stated, nor have we any precise estimate of the mortality. The most remarkable fact about this epidemic is that for the first and last time it spread over the Continent. On the 25th July 1528 (English style) or 1529 (Roman style), when it was beginning to decline in London, it suddenly appeared at Hamburg. The story went that the infection was brought by a ship returning from England, the sailors of which were suffering from the disease. However this may have been, the disease spread rapidly, so that in a few weeks more than a thousand persons died. In less than a week it had spread to Lubeck, and thus was the terrible sweating-sickness started on a destructive course, during which it caused fearful mortality throughout eastern Europe. France, Italy, and the southern countries were spared. It spread much in the same way as cholera, passing in one direction, from north to south, arriving at Switzerland in December, in another northwards to Denmark, Sweden, and Norway, also eastwards to Lithuania, Poland, and Russia, and westwards to Flanders and Holland, unless indeed the epidemic, which declared itself simultaneously at Antwerp and Amsterdam on the morning of September 27, came from England direct. In each place which it affected it prevailed for a short time only, generally not more than a fortnight. By the end of the year it had entirely disappeared, except in eastern Switzerland, where it lingered into the next year,¹ and the terrible "English sweat" has never appeared again, at least in the same form, on the Continent.

England was, however, destined to suffer from one more outbreak of the disease, which occurred in 1551, and with regard to this we have the great advantage of an account by an eye-witness, John Kaye or Caius, the eminent physician. It first appeared at Shrewsbury on April 13, and, after spreading to other towns in Wales and in the midland counties, broke out in London, causing in one week the death of seven hundred and sixty-one persons. At the end of July it ceased in London, but it went through the east of England to the north, until the end of August, when it began to diminish. At the end of September it ceased altogether, without affecting Scotland or Ireland. Nor did it apparently widely affect the Continent, though Caius mentions its occurrence at Calais, and Brasavolus (*De Morbo Gallico*) speaks of the English sweating-sickness as raging in Flanders in the year 1551, in which he wrote, causing the death of several thousand persons, and lasting at least till September.

Symptoms.—The symptoms as described by Caius and others were as follows. The disease began very suddenly with a sense of apprehension, followed by cold shivers (sometimes very violent), giddiness, headache, and severe pains in the neck, shoulders, and limbs, with great prostration,—in short, the usual symptoms of an acute febrile attack. In some cases the stomach was affected, and there was vomiting, but according to Caius this happened only in those who were full of food. The breathing was deep and frequent, the voice like a moan. After the cold stage, which might last from half an hour to three hours, followed the stage of heat and sweating. The characteristic sweat broke out suddenly, and, as it seemed to those unaccustomed to the disease, without any obvious cause. In some cases it was much more copious than in others, these differences depending, according to Caius, mainly on age, clothing, food and other external circumstances, and also on the season, sweating being more profuse in hot weather. With the sweat, or after that was poured out, came a sense of heat, and with this headache and delirium, rapid pulse, and intense thirst. Palpitation and pain in the heart were frequent symptoms. No

¹ Cf. G. A. N. N. N., *Dr. Engel's Schicksal in der Schweiz, Lichten* 1855, 1858.

eruption of any kind on the skin was generally observed, Calais makes no allusion to such a symptom. In the later stages there was either general prostration and collapse, or an irresistible tendency to sleep, which was thought to be fatal if the patient were permitted to give way to it. The malady was remarkably rapid in its course, being sometimes fatal even in two or three hours, and some patients died in less than that time. More commonly it was protracted to a period of twelve to twenty-four hours, beyond which it rarely lasted. Those who survived for twenty-four hours were considered safe.

The disease, unlike the plague, was not especially fatal to the poor, but rather, as Calais affirms, attacked the richer sort and those who were free livers according to the custom of England in those days. "They which had this sweet sore with peril or death were either men of wealth, ease, or welfare, or of the poorer sort, such as were idle persons, good ale drinkers, and tavern haunters."

Relapses were not uncommon, but the statements sometimes made about the disease attacking the same person several times seem to rest on a misunderstanding of the original authorities. What is meant is that they had several, even twelve, successive attacks of sweating. The disease was not thought to be transmitted by contagion from one person to another. Nevertheless, in its spread, it appears, like cholera, to have followed the main lines of human travel and traffic,—passing with Richmond's army to Bosworth, thence to London, and so on. It would be difficult otherwise to explain why Calais should have been affected and not the adjacent parts of France. Even the very circumstantial story of the disease having been brought to Hamburg by a ship from England seems by no means incredible, though it is doubted by some.

Causes.—Some attributed the disease to the English climate, its moisture and its fogs, a view which was thought to be supported by the occurrence of unusual rainfall and atmospheric moisture in the years of the sweating sickness. But it is plain that the English climate was much the same before and after, and can hardly be regarded even as a predisposing cause, certainly not as an explanation. Nor is there much evidence that the epidemic years were distinguished for their humidity.

In 1485, 1507, and 1517 the seasons were in no way remarkable. The year 1528 (1529 in Continental reckoning) was, however, certainly notable for excessive moisture. In England eight weeks continuous rain began in April, and the harvest was spoiled. In Germany the copious rainfall, and the cold fogs which endured through the summer, gave the impression that the air of England had been carried over to the Continent. In 1551 the outbreak of the sickness in Shrewsbury is described as having been preceded by dense and stinking fogs, which arose from the valley of the Severn and spread over other parts of England. The summer was everywhere very hot, and in England moist as well. In Amsterdam a similar fog announced the outbreak of the sickness in 1528. But we cannot attribute much importance to these circumstances, since in other epidemics they were wanting, and similar conditions have often occurred without any pestilence resulting.

It was again attributed by some to the intemperate habits of the English people, and to the frightful want of cleanliness in their houses and surroundings which is noticed by Erasmus in a well-known passage, and about which Calais is equally explicit. But causes such as these cannot, any more than climate, account for the incidence in time of an epidemic, even if they do something towards explaining its geographical range. Nor is there much evidence that the English were worse in these respects than most European nations, though the native country of Erasmus may have set an early example of cleanliness.

Calais and some of the chroniclers make out that this special liability of Englishmen to the sweating sickness followed them even into foreign parts, so that in Calais, Brabant, and Spain it affected the English only and not the natives. This is puzzling and improbable, except so far that the English abroad may have belonged to the same classes who mainly suffered at home. But a careful examination of those statements shows that they referred either to Englishmen who had left England while the disease was raging there and carried the infection with them, or to merchants and others who were in direct communication with home. This disease, like others introduced into a foreign country, did not always take root there. But it did so sometimes, as, according to contemporary evidence, was the case in Flanders in 1551. The statement also made that foreigners in England were not affected likewise requires qualification, since we know several instances of foreigners in London who died of it. On the whole, no great importance can be attached to this supposed special liability of the English physical constitution.

From all this we must conclude that climate, season, and manner of life were not adequate, either separately or collectively, to produce the disease, though each may have acted sometimes as a predisposing cause. The sweating sickness was in fact, to use modern language, a specific infective disease, in the same sense as plague, typhus, scarlatina, or ague. The origin of such diseases is not

explained by causes such as those above enumerated. We can only suppose that they come into being by laws similar to those which have determined the evolution of species of animals and plants. But when once their specific distinctness is established they "breed true" and always present the same characters.

Probable Identity with Miliary Fever.—The important question, however, arises—Did this specific disease exist before or has it existed after the sixty-six years of its recognized history? or is it identical with any other known disease called by another name? It is very unlikely that any epidemic of so striking a disease should have existed before without having been noticed, and there is certainly no record since of any outbreak precisely similar. The only disease of modern times which bears any resemblance to the sweating sickness is that known as miliary fever ("Schweiss friesel," "sette miliary," or "the Picardy sweat"), a malady which has been repeatedly observed in France, Italy, and Southern Germany, but not in the United Kingdom. It is characterized by intense sweating, and occurs in limited epidemics, not lasting in each place more than a week or two (at least in an intense form). On the other hand, the attack lasts longer than the sweating sickness did, is always accompanied by an eruption of vesicles, and is not usually fatal. It is therefore evidently not the same as the English disease, though allied to it. The first clearly described epidemic was in 1718 (though probably it existed before), and the last in 1861. Between these dates some one hundred and seventy-five epidemics have been counted in France alone. A single epidemic of a disease which had a striking resemblance to the sweating sickness was observed in 1802 at Rottingen, a village in the district of Würzburg, Germany. Its access was sudden, it affected chiefly robust persons, it was accompanied by profuse perspiration, rheumatic pains, &c., without any constant eruption. If death resulted it was usually in twenty-four hours. The epidemic lasted some ten days, and then entirely vanished. It may be considered as an extremely severe form of miliary fever. Finally, Hirsch has drawn attention to certain cases of a choleraic affection, observed first by Dr Murray in India (1839-40), which has been described as a sweating sickness. It has, however, more resemblance to miliary fever than to the English sweat. A similar form of disease has been described by some French physicians as "choléra eutane ou sudoral." On a review of the whole evidence, it would appear that the only disease which the sweating sickness much resembled was the miliary fever, of which it may conceivably have been, like the Rottingen epidemic, a highly malignant form.

Where did it Originate?—Whether it really originated in England is a question difficult to answer. Its appearance certainly coincided with the arrival of a foreign army, consisting, as we know, largely of foreign mercenaries, men of foul habits and irregular lives (whom the French king was thought to have done his country a service by getting rid of), and crowded into small vessels. Among such men any infective disease which arose would, by want of cleanliness and overcrowding, be likely to be fostered into great intensity. It is in accordance with the history of many epidemics to suppose that an ordinary and not very fatal disease might under such circumstances assume a malignant form.¹ Now, supposing that the French soldiers brought with them their native "Picardy sweat," a malady local and not severe in its French home, might not this have become developed into the formidable English sweating sickness? If so, its great destructiveness in England would also be in great measure explained by its affecting a new population. For we find that any exported epidemic disease is generally more fatal in a country which receives it for the first time, among a population which offers a virgin soil to the disease, than it was in the country where it was endemic, and where men were inured to the infection. The notable exemption of northern France from the true sweating sickness would then have depended upon the population there being already inured to a milder form of the same disease. As to southern France and other countries of the south, they were evidently not adapted by climate to receive the infection. If this be true, we need hardly expect to see the sweating sickness again. The sweat of Picardy may continue from time to time to produce its comparatively slight epidemics, but the conditions which launched the English sweat on its rapid career of destruction are unlikely to occur a second time. The example of the Rottingen epidemic, which on a small scale was scarcely less remarkable, may show, however, that such an event is not quite impossible.

Authorities.—For history see Bacon's *Life of Henry VII.*, and the chronicles of Grafton, Hollinshed, Baker, Fabyan, &c. The only English medical account is that of John Calais, who wrote in English *A Booke or Countreill Against the Disease commonly called the Sweate, or Sweating Sickness* (London 1567), and in Latin *De Ephemera Britannica* (Louvain, 1566; reprinted London, 1721). The English tract is reprinted in Babincton's translation of Hecker's *Epidemics of the Middle Ages*, Syd. Soc., 1844. This also contains Hecker's valuable treatise on the English sweat, published in German 1834, and also printed in his *Uebersicht der heissen des Mittelalters*, edited by Hirsch, Berlin 1865. Gräber's *Scriptores de Sudore Anglico* Jena 1847 contains nearly all the original documents, including the two treatises of Calais. See also Hirsch, *Handbook of Geographical and Historical Pathology*, trans. by Creighton New Syd. Soc. 1884. (J. F. I.)

¹ This is the case even with the Oriental plague itself. See PLACON.

PART I.—GEOGRAPHY AND STATISTICS

For map
see vol
xvii.
Plate
XX.

SWEDEN comprises the eastern and southern divisions of the Scandinavian peninsula. Its northern extremity, Knokimodka, is situated in $69^{\circ} 3' 21''$ and the southern in $55^{\circ} 20' 18''$ N lat. The western extremity (on the Cattegat) lies in $11^{\circ} 6' 29''$ and the eastern (on the frontier of Finland) in $24^{\circ} 10'$ E long. The greatest length of the country from north to south is 986 miles and its greatest breadth 286 miles, and the area is 170,713 square miles. The length of the coast-line is 1603 miles, the length of the boundary line towards Norway 1019 miles, and that of the boundary line towards Finland 305 miles.

Sweden is divided into three chief parts,—the southern being called Götaland, the middle part Svealand or Sweden proper, and the northern Norrland. The north and north west parts of Norrland are called Lapland.

Mountain and
river
systems

The frontier towards Norway, from 69° to 63° N lat, is formed by a continuous mountain range called Kölen (the keel). The snow peaks of Sulitelma (6178 feet), east of Saltenfjord, on the frontier between Sweden and Norway, were long supposed to mark the highest elevation of this mountain chain, but the geodetical survey now in progress in western Lapland has already shown that there are at least two peaks whose height exceeds that of Sulitelma, viz, Kefnekaise (7008 feet) and Sarjektjåkko (6988 feet).

In this mountain range (Kölen), rise a great number of rivers and streams, which flow in a south easterly direction to the Gulf of Bothnia. The immense quantity of fresh water that is thus carried into the gulf makes its water scarcely more salt than that of a lake (0.25 to 0.40 per cent of salt). Between the upper courses of the rivers the watersheds consist of mountain ridges, which gradually diminish in height. The intermediate valleys are for the most part filled with the water of the rivers, and thus form a number of lakes at a considerable elevation above the sea-level. Issuing from these lakes, the rivers form great cataraacts, and afterwards flow through the level plain that forms the coast-region of the Gulf of Bothnia for a distance of many miles from the shore.

The boundary between Sweden and Finland is formed by (1) Muonio Elf, and afterwards by (2) Torneå Elf, into which it flows, Torneå Elf rises in Torneå Träsk, at an elevation of 1132 feet above the sea. Then come, in order along the coast, the following rivers—(3) Kalix Elf, which in its upper course forms the lakes of Paitas Jaur and Kalas Järv, (4) Stora Luleå Elf (242 miles), which forms Stora Luleå Jaur (1214 feet) and receives on the right (5) Lilla Luleå Elf, which forms the lakes of Saggat Träsk and Skalka Jaur (984 feet), (6) Piteå Elf, with the lake of Tjiggelvas, (7) Skellefteå Elf, forming a number of great lakes, such as Hornafvan (1391 feet), Uddjanr (1375 feet), Storafvan (1371 feet), (8) Umeå Elf (261 miles), with a great number of lakes, of which the largest is Stor Uman, receives on the left a tributary of almost equal size, viz, (9) Vindel Elf, (10) Ångerman Elf (211 miles), which receives the water of a whole system of streams and lakes, the largest of the latter being Ströms Vattudal, in the south of Lapland, (11) Indals Elf, which receives the Ammeri, with its tributaries and the numerous emussary lakes, as Hotagen (1017 feet), Kallsjön and Storsjön ("Storsa Lake" on the map) (958 feet, area 173 sq miles). Close to the railway from Trondhjem to Östersund, between

¹ The word for "lake," which is *jū* or *träsk* in Swedish, is *jaur* in Lapponian, and *järr* in Finnish. "River" is *elf* in Swedish.

Kallsjön and Storsjön, rises the peak of Åreskutan (4652 feet), which is ascended every year by a great number of tourists, and in the vicinity many sanatoria are situated. Farther south flow three large rivers—(12) Ljungan (193 miles), with Holmsjön (656 feet), (13) Ljusnan (249 miles), and (14) Dal Elf (286 miles), which passes through Sarnasjön (1450 feet) and Siljan (541 feet, 110 sq miles), and receives on the right (15) West Dal Elf. The last-named four rivers rise in a mountainous region with many high summits, which are the eastern outposts of the high range of Dovrefjeld, which traverses Norway from west to east, between the parallels of 67° and 63° N lat. Among these summits, situated on the frontier or in Sweden, are to be observed the Syltoppar (5865 feet), Son Fjell (4190 feet), Helags Fjell (5900 feet), and Städtjan (3860 feet) on the north shore of Sarnasjön.

In Norway, not far from the sources of Dal Elf, lies the lake of Femundsjo, which gives rise to (16) Klar Elf, which flows southwards to Lake Vener, the largest lake in Sweden (144 feet, area 2150 square miles). The outlet of Vener is (17) Gota Elf, which falls into the Cattegat, near Gothenburg. The watershed between Dal Elf and Klar Elf is a wooded range of hills without high peaks, sloping to the south east. The south eastern part of Svealand comprises the water systems of the large lakes of Hjelmär (75 feet, area 185 square miles) and Mälär (area 449 square miles). Lake Mälär discharges into the Baltic at Stockholm by two outlets—(18) Norrström and Söderström. They are, however, almost to be regarded as channels or sounds, rather than as streams, the difference of level between Lake Mälär and the Baltic being so small that occasionally, when the water is low in Mälär and high in the Baltic, the current sets from the latter into the former. Lake Mälär may thus be considered a fjord of the Baltic. Still its waters are kept fresh by the great number of small streams that discharge into it, the most important of these being (19) Fyris Elf, which passes Upsala.

The boundary between Svealand and Götaland consists of wooded heights. Between Lake Vetter and the northern shore of Brävikens Bay stretches the forest of Kolmorden, and between the northern extremity of Lake Vetter and Lake Vener lies that of Tiveden. Lake Vetter (290 feet, area 733 square miles) discharges itself into Brävikens by (20) Motala Ström, the falls of which are utilized for the mills in the town of Norrköping, near the mouth of the river.

The central part of Götaland consists of an extensive tableland or plateau, of which the highest part, at an elevation of 1237 feet, lies somewhat to the south of Vetter. On the north this plateau descends rather abruptly towards the fertile plains of Ostergötland (drained by Motala Ström) and Skaraborg län, between Vetter and Vener. Near the south-eastern shore of Vetter, a little to the north of Jönköping, lies Monnt Omberg (863 feet), and near the southern shore of Vener, close by Lidköping, lies Kinnekulle (915 feet), both hills remarkable for their beauty. The great plateau descends less abruptly towards east, south, and west. A great number of lesser streams flow down its slopes. The principal are—(21) Emmån, which falls into Calmar Sound, (22) Lyckebyån, (23) Mörrumsån, and (24) Helgaån, which flow in a southerly direction, and (25) Lagan, (26) Nissan, (27) Atran, and (28) Viskan, which fall into the Cattegat. On this great plateau and its slopes lie also many lakes. In the northern part, east of Vetter, lies Sommen (479 feet), and farther north Boren, Roxen, and Glan. Between

Vetter and Vener lies Undeu (384 feet) On the summit of the plateau lies Ekelsjö (1132 feet), and on its southern slope Helsingö (535 feet), Bolmen (466 feet), Mockeln (446 feet), and Åsnen

The southmost part of Sweden, Skåne, consists for the most part of a low fertile country Only in the northern part, Christianstad län, occur two low stretches of hills, called Linderödsåsen and Soderåsen

Water
falls

Waterfalls—The largest waterfalls are—(1) Njuom-melsåska (Harpånget), in Stora Luleå Elf, with a breadth of 60–70 feet, consisting of two cataracts of 103 feet at the upper end and a fall of 150 feet more in the course of 1½ miles,—the largest waterfall in Europe, (2) Adnamuorki-Kortjo ("the great fall of the lake"), on the same river as the former, higher up, between the two lakes Jantajaur and Kaskajaur, has a fall of 130 feet, of which 100 feet are one perpendicular cataract, (3) Tannforsen, 12 miles west of Åreskutan in Jemtland, between Tannsjön and Noren, has a breadth of 160 and a perpendicular fall of 84 feet, (4) Trollhättan, in Gotr Elf, consists of three successive falls having a total height of 100 feet.

Charac-
ter of
surface.

It will be seen that, with the exception of the north-west part along the Norwegian frontier, Sweden is not a mountainous country On the other hand, fertile plains are not frequent The most extensive are the north-west shore of the Gulf of Bothnia, where, however, the severe climate precludes any successful agriculture, the water districts of Lake Mälär and Lake Hjälmjär, the rich agricultural district of Östergötland between Vetter and the Baltic, Västergötland, or the whole country between the two great lakes as far as Gothenburg, and, as has been just mentioned, the southmost part, or Skåne, which comprises Christianstad and Malmöhus län The greatest part of the country consists of low hills of granite or gneiss, clothed with forests of pine and fir The valleys are generally in great part filled with water, and the shores of their lakes or wide rivers are covered with forests of deciduous trees, chiefly birch, or consist of arable soil With the exception of Finland there is no country so full of lakes as Sweden Nearly one twelfth of the whole surface of the country, or about 13,900 square miles, is covered with water

Coast

Coast—The coast of Sweden is not broken by so many or so deep fjords as that of Norway The most considerable indentation is the above mentioned Brävikens Bay On the other hand, the Swedish coast is, perhaps in a still greater degree than the Norwegian, fringed by innumerable little islets Except on the coast round Skåne, in the south, the mainland does not come into direct contact with the sea, girdled as it is by a belt of islands, holms, and skerries, more or less thickly set, which forms the so called "skargård" fence of skerries or outer coast Between this wall of islets and the mainland, therefore, extends a connected series of sounds of the greatest importance for coastal navigation, since they admit of the employment of vessels of less size and strength This skargård forms, besides, a most valuable natural defence, for, while some sounds are deep, navigation in the vicinity of the coasts is, as a rule, practically impossible without the help of pilots

The
"skar-
gård"

The broadest part of this skargård is that off Stockholm, which stretches many miles out into the Baltic It consists of a few large and well peopled islands, surrounded by many hundreds of islets, for the most part uninhabited The outer islands are bare grey rocks of gneiss, but the inner ones are mostly covered with fir and birch trees The entrance to Stockholm through this archipelago is of its kind one of the most curious and picturesque in the world The largest of these islands are Ljustero, Vermdo, Ingaro, Vindo, Runmaro, Orno, and Uto (with rich iron mines) As mentioned above, Lake Mälär is to be con-

sidered as a fjord of the Baltic The skargård also extends into Mälär, which is filled with islands The most remarkable is Björko, where the old town of Birka was situated The archaeological researches on this spot have been of the greatest importance for our knowledge of life in Sweden in the times of the vikings The part of the skargård next in breadth is that off Karlskrona, where the islands of Sturko, Tjurko, Aspö, and Hasslo are situated

The Cattegat skargård, which extends from the fjord of Svinesund at the southern extremity of the Norwegian frontier as far as Halmstad, has a different aspect from that of the Baltic In the Cattegat all the islands, as well as the rocks of the mainland, are almost bare of vegetation Trees are quite absent in most places, and generally the grey rocks are not even covered with grass or moss They look as if they were polished by the sea Between these bare rocks there is, however, in many places even on the larger islands arable soil of great fertility In the northern part of the skargård near Stromstad lie the larger islands of Sandö, Odo, Tjerno, Roso, &c Farther seawards lie the Koster Islands and the Vader Islands with their lighthouses A little more to the south, in the vicinity of Lysekil, are three narrow fjords—Åbyfjord, Gullmarfjord, and Kolsefjord Off the first-named lies Malmö,¹ remarkable for its quarry, where the fine granite of which the island consists is wrought Next come, in succession, Korno, Skaflo, Flato, Hermano, and Lyro, the last two situated off the two largest islands on this coast, Örust and Tjörn All the islands now enumerated are surrounded by innumerable islets and rocks South of Tjörn there are no considerable islands except Marstrand (with a small town and much frequented sea-bathing quarters), Koo, and Klofverö, all situated immediately to the south of Tjörn On the coast of Halland we find only Sarö, off the fjord of Kungsbacka, and the Väderö of Halland, off Toreköv, between Laholm Bay and Skolder Bay, the only islands on the whole coast that are covered with a rich vegetation of trees On the extreme point of the cape, between the latter fjord and the Sound, lies the isolated Mount Kullen with its lighthouse In the Sound off Landskrona lies the islet of Hven, where Tycho Brahe had his observatory, Uranienborg, in the end of the 16th century (1576–1597)

In the Baltic lie the two great islands of Gotland and Öland, of which the former is itself a county and a bishopric. These islands are quite different from the Swedish mainland They are formed of Silurian limestone On the western coast of Gotland the limestone rocks descend precipitously into the sea, and the island forms a comparatively smooth plateau, which slopes gradually to the east The limestone soil is very fertile, and trees and plants thrive on it that do not otherwise grow in the climate of Sweden, such as walnuts, ivy, &c The case is the same in Öland This island somewhat resembles a house-top A sterile limestone plain (Alvaren) stretches the whole length of the island from north to south, and from this the country slopes both towards Calmar Sound on the west and towards the Baltic on the east The slopes, especially the western, are very fertile

Sea-Bed—The seas that surround Sweden are remarkably shallow Round the south part of Norway runs a depression in the sea-bed, called the Norwegian Channel (see NORWEGIAN SEA) It stretches along the west and south coasts of Norway southward and eastward almost to Christiansia Fjord and the Cattegat The deepest part of this channel, upwards of 400 fathoms, extends through the Skagerack between Arendal in Norway and the Scaw In the Cattegat the depth diminishes abruptly, and

Depths
of sur-
rounding
sea

¹ Not to be confounded with the town of Malmö in Skåne.

between Gothenburg and the Scaw the greatest depth is between 33 and 35 fathoms. The greatest part of the southern half of the Cattegat has a depth of less than 30 fathoms. The depth of the Sound generally is even less than 12 fathoms. The whole southern part of the Baltic between Sweden and Germany is very shallow. West of Bornholm the depth nowhere reaches 30 fathoms. East of Bornholm the sea is somewhat deeper, and a small area of a depth of 50 to 60 fathoms is found a little east of that island. The whole of that part of the Baltic which lies between Sweden and Russia is divided into two separate basins by a submarine bank. From the southern extremity of Gotland (Hoburg) there extends a nearly uninterrupted bank to the south-west as far as the Prussian coast. The depth on this bank nowhere reaches 30 fathoms. The shallowest parts are Hoburg Bank south of Gotland, Mittel Bank south-east of Oland, and Stolpe Bank off the Prussian coast. Between Fårö off the north coast of Gotland and the Gottska Sandö there extends a similar bank, which continues with a somewhat greater depth of about 30 fathoms as far north as Stockholm. The deepest part of the Baltic between these banks is situated in the north part between Landsort and the Gottska Sandö, the maximum depth being about 160 fathoms. Ålands Haf, the channel between the Swedish coast and the Åland Islands, is tolerably deep (100 to 160 fathoms).

The Gulf of Bothnia is divided into two basins by the channel of Qvarken, the southern is the deeper (about 50 fathoms), and the depth increases towards the north-west, where, over a small area off the island of Ulfbö near the Swedish coast, it reaches 160 fathoms. The channel of Qvarken is very shallow (8 to 16 fathoms). The basin on the north side is also shallow. Only over a small area off Bjurö Cape does the depth exceed 160 fathoms.

Climate

Climate—Sweden is situated between two countries of very different climatological conditions. On the west there is the maritime climate of the Norwegian coast, and on the east the continental climate of Russia. It may be said that Sweden alternates between the two. Cold winters alternate with mild ones, and warm and dry summers with cool and rainy ones. But different parts of Sweden have also in this respect a greatly differing climate, of which we readily see the reason if we only recollect the character and the general features of the configuration of the country. Lapland and the western part of the country along the Norwegian frontier have a pronounced continental climate, and so has the high plateau to the south of Lake Vetter. On the other hand, the climate is more maritime the more we approach the coasts of the Baltic, and on the coast of the Cattegat and in Skåne the maritime climate distinctly predominates.

Temperature.

The following table gives the mean annual temperatures (Fahr.) at twenty eight meteorological stations in Sweden, together with the means for January and July—

Station.	Annual.	Jan.	July	Station.	Annual.	Jan.	July
Lund	44.3	31.3	61.7	Örebro	41.6	25.8	62.6
Carlshamn	44.4	31.1	61.7	Stockholm	41.4	26.1	61.4
Calmar	44.2	30.2	62.1	Carlstad	41.6	24.9	62.9
Halmstad	44.8	30.0	62.7	Vesterås	41.0	24.7	62.6
Vexjö	42.3	27.5	61.2	Upsala	40.4	24.4	61.6
Visbo	43.4	30.7	60.3	Falun	39.7	20.8	61.2
Gothenburg	44.4	29.8	62.1	Gefle	40.0	24.0	61.0
Vesterik	42.8	28.1	61.4	Hernösand	37.1	20.0	58.9
Jönköping	42.7	28.6	61.0	Ustersund	35.0	1.3	56.4
Venerborg	42.3	27.5	61.1	Umeå	34.4	15.8	53.8
Skara	41.5	26.0	60.3	Sensele	31.7	9.5	57.7
Ljököping	43.4	27.8	63.9	Piteå	33.8	11.2	60.6
Viköping	41.0	26.6	61.4	Haparanda	31.9	10.1	59.4
Åskersund	41.0	26.1	61.2	Jockmock	29.1	7.1	58.0

From these figures it appears that, as mentioned above, the climate is most continental in the northern and interior parts of the country, especially at the two stations of Lapland, Stensele and Jockmock, while it is more maritime on the coasts. For this reason the isotherms for January on the Scandinavian peninsula are linguiform. The warm sea off Norway causes the peculiarity that the western parts of Lapland, although situated at the greatest elevation above the sea, have not so cold winters as the interior parts round the great lakes. Still farther to the east the temperature increases again towards the coast of the Gulf of Bothnia.

Thus, for example, the isotherm of 10° F enters Lapland from the north-east at about 68° N lat., runs towards the south west over the great lakes as far as about 64½°, south of Lake Stor-Uman, makes there an abrupt bend towards the east, and runs in a north-easterly direction to Haparanda at the northern extremity of the Gulf of Bothnia. The isotherm of 23° F runs from the great lake of Mjösen in Norway, north of Christiania, to the southern shore of Lake Siljan, or almost straight east, curves there to the north east, and reaches the shore of the Gulf of Bothnia a little north of the mouth of Ljusnan. Finally, the isotherm of 30° runs from Gothenburg towards the south-east to the lake of Åsnen, curves towards the north-east, and passes Calmar and the northern parts of the islands Öland and Gotland. On the summit of the plateau south of Vetter the mean temperature is of course lower than both north and south of the plateau. In July the temperature is almost constant all over the country. With the exception of the interior of Lapland the mean temperature varies generally between 59° and 62°. The warmest point is Linköping on the plain of Östergötland, between Lake Vetter and the Baltic. The most temperate and most agreeable climate of the whole country is that of the Cattegat coast round Halmstad.

A good indication of the climate, especially that of the winter, is Equi the time during which the freshwater lakes remain frozen. We glacia have seen that nearly one twelfth of the whole surface of Sweden is covered with water, and in Finland the number of the lakes is still greater. In both countries the times of freezing and breaking up of a great many lakes have been observed for many years. From these data we can calculate the length of the ice periods. If these periods are entered on a diagram, we can draw out the lines of equal ice periods, or the equi glacial lines. The accompanying map shows these lines for Sweden and Finland. From it we see that the glacial period in the southern part of the country is 90 days, while in the northern part of Lapland it has a duration of no less than 230 of the 365 days of the year. The western lakes of Lapland, though the higher in situation, have a somewhat shorter

Map of Equal Ice Periods

ice period than the eastern. The ice period is considerably lengthened on the great plateau south of Lake Vetter.

We have said above that in certain years the climate of Sweden varies is more maritime, in others more continental. Thus, for instance, the annual mean temperature of Upsala has varied during the time last 30 years between 43° 2 (1859) and 35° 0 (1867). The mean temperature of particular months varies of course in a still higher degree, especially during the winter, thus the mean temperature of January 1873 was 34° 3, but of January 1875 only 12° 2.

The difference between the means of the warmest month and the coldest is the so called yearly range of temperature. In Sweden July is generally the warmest and February the coldest month. The difference between the January and July temperatures, however, as given in the foregoing table, will show the yearly range approximately. It will be seen that this increases towards the north. For the same latitude, it is greater in the interior of the country than on the coasts.

As is easily understood, the periodic daily range of temperature is least during the darkest part of the year, during December and January, especially in the north part of the country round the polar line, and still farther north, where it is almost nil. The mean range for the whole country is in December only 2°. The

maximum occurs in June or July at all stations except those of western Sweden, where it occurs as early as May. The mean of June is 13°. A curious fact is that in Norrland, especially in the interior, a secondary maximum occurs in March, which some times even exceeds the summer maximum.

The non periodic daily range of temperature, or the difference between the monthly means of daily maximum and minimum of temperature, is as usual considerably greater than the periodic. The difference is almost constant for all stations, especially during the warmer part of the year. We have, for the whole country—

	Non periodic	Periodic	Difference
Winter	10° 0	3° 0	7° 0
Spring	16° 0	11° 2	4° 8
Summer	19° 1	13° 0	6° 1
Autumn	11° 7	6° 3	5° 4

Winds The mean direction of the winds shows little variation during different seasons. During the summer it is west or west south west in the south of Sweden, changes to south west in the middle part of the country, and due south along the coast of the Gulf of Bothnia. In winter north north-east winds become comparatively frequent in the north part of the country. This is explained by the difference in barometric pressure in summer and in winter. In July the mean height of the barometer indicates a gradual fall along the coast of the Baltic, from 29.828 inches in Calmar to 29.675 in Haparanda. In January, on the other hand, there is a gradual fall from 29.853 in Calmar to 29.718 in Hernösand, but thereafter a gradual rise to 29.834 in Haparanda. Unfortunately the isobarometric lines for Sweden have not yet been calculated with due precision.

Rainfall. The rainfall is greatest on the coast of the Cattegat. The annual amount is greatest at Gothenburg, where it is 32.56 inches. At Halmstad it is 28.26, and at Venersborg, where Gota Elf issues from Lake Vener, it is 30.33. These are the rainiest stations of Sweden. Generally speaking, the amount of rain diminishes afterwards as well towards north and north west as towards south east. The least rain falls on the one hand in northern Lapland, where the annual amount is only 15.52 inches, and on the other hand in the south eastern corner of Sweden, where (at Calmar) we have the lowest known rainfall for the whole country (12.75 inches). Between these two tracts there runs a belt of greater precipitation from Gothenburg towards the north east to Upsala, where the annual amount is 23.28. Even along this belt the amount of rainfall diminishes towards the north east, but at every point the amount is greater than to the north west and south east of it. The greatest amount of rain falls in July and August and the least in February and March. Thus, for instance, there fall in Upsala during August 2.86 inches and during March 0.99 inches. As the temperature varies, so does the rainfall for different years.

Thunder storms. The number of thunderstorms is small in Sweden compared with the countries of the south. Their number diminishes as does the precipitation from south west towards north and east. From 1871 to 1880 the mean annual number of thunderstorms at each station was 9.5 in Gotland, 8.4 in Svealand, and only 6.3 in Norrland. In the south their number diminishes rapidly from west to east, from 11 on the coast of the Cattegat to 3.3 on the coast of the Baltic, and only 6.6 on the island of Gotland. The thunderstorms have a distinctly marked annual and daily period. They occur almost always during the warmest time of the year and of the day. During the above mentioned ten years the least number occurred during the month of February, only 3, whereas there occurred in May 1194, in June 3724, in July 4419, in August 3308, and in September 1461. As regards the daily period, the least number, 147, occurred between 1 and 2 A.M., and the greatest, 1704, between 3 and 4 P.M. In Gotland and Svealand most of the thunderstorms come with a south westerly wind, in Norrland with a southerly, for the whole country, the least number come with a northerly wind.

Hail. If the number of thunderstorms is small in Sweden, the same is in a still higher degree to be said of their intensity. Hail, which on the Continent causes such immense damage to the growing crops, is rare in Sweden, and often quite harmless. In the south of Germany about 2 per cent. of the crops are annually destroyed by hail. At Magdeburg the damage is 0.9 per cent., at Berlin 0.6 to 0.7 per cent., but in Sweden only 0.06 per cent. (H. H. H.)

Geology. The fundamental rocks of Sweden belong to the Azoic or Pre-Cambrian formation, and consist of crystalline rocks. Three great divisions of this formation may be distinguished,—the grey gneiss, the red iron gneiss, and the granulite.

The grey gneiss rules in the northern and western parts of the country, from West Norrland down to the province of Calmar. The rock has a prevalent grey colour, and contains as characteristic minerals garnet and in some parts graphite.

The red iron gneiss prevails in western Sweden in the provinces of Vermland, Skaraborg, Elfsborg, and down to the province of

Christianstad. The formation is very uniform in its character, the gneiss having a red colour and containing small granules of magnetite, but, nevertheless, not a single iron mine belongs to this region. The red gneiss contains in many places beds or masses of hyperite.

The granulite, also called curite and halleflinta, is the most important of the Pre Cambrian formation, as it contains all the metalliferous deposits of Sweden. It prevails in the middle part of the country, in the provinces of Vermland, Kopparberg, Vestmanland, and Upsala. It occurs also in some parts of the provinces of Östergötland, Calmar, and Kronoberg. The main rock in this region consists of halleflinta, a kind of very compact and fine grained mixture of feldspar, quartz, and mica, often graduating to mica schists, quartzite, and gneiss. With these rocks are often associated limestones, dolomites, and marbles containing serpentine (Kolmården). The metalliferous deposits have generally the form of beds or layers between the strata of granulite and limestones. They are often highly contorted and dislocated.

The iron mines occur imbedded in more or less fine grained gneiss or granulite (Gellivara, Grangesberg, Norberg, Ströberg), or separated from the granulite by masses of augitic and amphibolous minerals (*grönskarn*), as in Persberg and Nordmark. Sometimes they are surrounded by halleflinta and limestones, as at Dannemora, Langban, Pajsberg, and then carry mauganiferous minerals. Argentiferous gneiss occurs at Sala in limestone, surrounded by granulite, and at Guldsmidshyttan (province of Örebro) in dark halleflinta. Copper pyrites occurs at Falun in mica schists, surrounded by halleflinta. Zinc blends occur in large masses at Ammeberg, near the northern end of Lake Vetter. The cobalt ore consists of cobalt glance (Tunnberg in the province of Södermanland) and of linneite (at Gladhammar, near Västervik). The nickel ore of Sweden is magnetic pyrites, containing only a very small percentage of nickel. The magnetic pyrites occurs generally imbedded in diorite and greenstones. In the evidently most recent division of the granulite occurs clay slate (at Grythyttan in the province of Örebro).

Large masses of granite are found in many parts of Sweden, and form extensive massifs as in the provinces of Kronoberg, Örebro, Göteborg, Stockholm, &c. Sometimes the granite graduates into gneiss, sometimes (as north of Stockholm) it encloses large angular pieces of gneiss. In many parts of Sweden occur greenstones, as hyperite, gabbro (anorthite gabbro at Rådmansö in the province of Stockholm), and diorite, the last often forming beds between the strata of the gneiss.

The Cambrian formation occurs generally associated with the Lower Silurian, and consists of many divisions. The oldest is a sandstone, in which are found traces of worms, impressions of *Medusa*, and shells of *Langula*. The upper divisions consist of bituminous limestones, clay slates, alum slate, and contain numerous species of trilobites of the genera *Paradoxides*, *Conocoryphe*, *Agnostus*, *Sphaerophthalmus*, *Peltura*, &c. In Öland and north of Siljan are found beds with *Obolus*.

The Lower Silurian consists of the following divisions:—(1) beds with *Ceratopryge*, (2) schists with Graptolites, (3) large beds of red and grey limestone (200 feet in thickness) containing *Algalagrana* and *Orthoceras*. This limestone is largely used as building material, (4) slates with *Trinucleus*, (5) slates with Brachiopods, (6) slates with Graptolites. The Cambrian and Lower Silurian strata occur scattered in several places from Västervik down to Jämtland (around Storlien), and in the provinces of Skaraborg, Elfsborg, Örebro, Östergötland, and Christianstad. The whole of the island of Öland consists of these strata. The strata are in most places very little disturbed, and form horizontal or slightly inclined layers. They are, south of Lake Vener, capped by thick beds of eruptive diabase (called *trapp*). North of Lake Siljan (province of Kopparberg) occur Lower Silurian but not Cambrian strata, which have been very much dislocated. The Upper Silurian has in Sweden almost the same character as the Wenlock and Ludlow formation of England. The island of Gotland consists entirely of this formation, which occurs also in some parts of the province of Christianstad. In the western part of the province of Kopparberg are extensive deposits of sandstone, separated by beds of diabase, and seemingly of the same age,—the Middle Silurian,—but no fossils have been found in them. In the vicinity of this sandstone region are large beds and massifs of porphyries of this sandstone region are large beds and massifs of porphyries. There are still two sets of stratified, not fossiliferous, deposits, viz., in the province of Elfsborg (formation of Daleland) and around Lake Vetter (formation of Visingsö). The Daleland formation, which attains the thickness of 6000 to 7000 feet, consists of conglomerates, chlorite schists, quartzites, and mica schist. The Visingsö formation, 800 to 1000 feet in thickness, consists of sandstones, clay slate, &c. In the western and northern alpine part of Sweden, near the boundaries of Norway, the Silurian strata are covered by crystalline rocks, mica schists, quartzites, &c., of an enormous thickness. These rocks form the mass of the high mountain of Åreskutan, &c.

The Triassic formation (Rhetic division) occurs in the northern

part of the province of Malmöhus. This formation consists partly of sandstones with impressions of plants (cycads, ferns, &c.), and partly of clay beds with coal.

The Cretaceous formation occurs in the provinces of Malmöhus and Christianstad. Also some spots of this formation are found in the province of Blekinge. The Cretaceous beds of Sweden belong to the most recent division of the Cretaceous formation (chalk and danien). In many parts it has all the characteristics of a coast deposit.

The most recent deposits of Sweden date from the Glacial and Post-Glacial periods. At the beginning of the Glacial period the height of Scandinavia above the level of the sea was greater than at present, Sweden being then connected with Denmark and Germany and also across the middle of the Baltic with Russia. On the west the North Sea and Cattegat were also dry land. On the elevated parts of this large continent glaciers were formed, which, proceeding downwards to the lower levels, gave origin to large streams and rivers, the abundant deposits of which formed the diluvial sand and the diluvial clay. In most parts of Sweden these deposits were swept away when the ice advanced, but in Skåne they often form still, as in northern Germany, very thick beds. At its maximum the inland ice not only covered Scandinavia but also passed over the present boundaries of Russia and Germany. When the climate became less severe the ice slowly receded, leaving its moraines, called in Sweden *krosstenslera* and *krosstengräs*. Swedish geologists distinguish between *bollengräs* (bottom gravel, bottom moraine) and ordinary *krossgräs* (terminal and side moraine). The former generally consists of a hard and compact mass of rounded, scratched, and sometimes polished stones firmly imbedded in a powder of crushed rock. The latter is less compact and contains angular boulders, often of a considerable size, but no powder. Of later origin than the *krosstengräs* is the *villstengräs* (gravel of rolled stones), which often forms narrow ranges of hills, many miles in length, called *åsar*, running generally, independent of the relief of the country, in a north and south direction or towards the south east. They are of the same nature as the lames and eskers in Ireland and Scotland, and consist of rolled pebbles and sand. It is very probable that these *åsar* were formed on the bottoms of rivers which cut their way in the inland ice. During the disappearance of the great inland ice large masses of mud and sand were carried by the rivers and deposited in the sea. These deposits, known as glacial sand and glacial clay, cover most parts of Sweden south of the provinces of Kopparberg and Vermland, the more elevated portions of the provinces of Elfsborg and Kronoberg excepted. In the glacial clay shells of *Foldia arctica* have been met with in many places (e.g., near Stockholm). At this epoch the North Sea and the Baltic were connected along the line of Vener, Votter, Hjelm, and Malar. On the other side the White Sea was connected by Lakes Onega and Ladoga with the Gulf of Finland and the Baltic. In the depths of the Baltic and of Lakes Vener and Votter there actually exist animals which belong to the arctic fauna and are remnants of the ancient ice sea. The glacial clay consists generally of their darker and lighter coloured layers, which give it a striped appearance, for which reason it has often been called *hvarfenglera* (striped clay). The glacial clay of the Silurian regions is generally rich in lime and is thus a marl of great fertility. The deposits of glacial sand and clay are found in the southern part of Sweden at a height ranging from 70 to 150 feet above the level of the sea, but in the interior of the country at a height of 400 feet above the sea.

On the coasts of the ancient ice sea, in which the glacial clay was deposited, there were heaped up masses of shells which belong to species still extant around Spitzbergen and Greenland. Most renowned among these shell deposits are the Kapellbackarne near Uddevalla. With the melting of the great ice sheet the climate became milder, and the southern part of Sweden was covered with shrubs and plants now found only in the northern and alpine parts of the country (*Salix polaris*, *Dryas octopetala*, *Betula nana*, &c.). The sea fauna also gradually changed, the arctic species migrating northward and being succeeded by the species existing on the coasts of Sweden. The Post-Glacial period now began. Sands (*mosand*) and clays (*åkerlera* and *fucuslera*) continued to be deposited on the lower parts of the country. They are generally of insignificant thickness. In the shallow lakes and enclosed bays of the sea there began to be formed and still is in course of formation a deposit known by the name *gyttja*, characterized by the diatomaceous shells it contains. Sometimes the *gyttja* consists mainly of diatoms, and is then called *bergmyöl*. The *gyttja* of the lakes is generally covered over by peat of a later date. In many of the lakes of Sweden there is still in progress the formation of an iron ore, called *gömalin*, ferric hydroxide, deposited in forms resembling peas, coins, &c., and used for the manufacture of iron.¹

(P. T. C.)

¹ The geology of Sweden has been worked out principally by Hisinger, Forselles, Erdmann, Turnebom, and others. A systematic geological survey of Sweden was set on foot by the Government in 1838. The geology of the fossiliferous strata of Sweden has been elaborated chiefly by Nilsson, Angolin, Linnarsson, Lindström, Nathorst, and others and that of the Glacial and Post-Glacial periods by Sefström, Von Post, Torell, and others.

Flora.—Of the whole area of Sweden about 132,000 square miles. Flora are covered with wild vegetation. This may be broadly divided into five different sorts, viz., the forest, bush, marsh, heath, and prairie vegetations, of which the first mentioned covers by far the largest area, or upwards of 40 per cent. of the whole surface of Sweden. In the northern part of the country the fir (*Pinus sylvestris*) and the pine (*Pinus Abies*) are the predominating trees, south of Dal Elf the oak (*Quercus pedunculata*), and in the southern and south western provinces the beech (*Fagus sylvatica*), are, together with the fir and pine, the forest forming trees. Besides these, there are two species of birch (*Betula verrucosa* and *B. odorata*), which form considerable forests. The bush vegetation derives its character from various species of *Salix*, *Rubus*, and *Rosa*, from *Prunus spinosa* and several other species. The marsh vegetation is composed of some low bushes, of *Cyperaceæ*, *Gramineæ*, and a small number of dicotyledonous and large flowered monocotyledonous plants. The heath vegetation consists principally of socal *Ericaceæ*, especially heather (*Calluna vulgaris*), and the prairie vegetation of a considerable variety of plants.

The Swedish phanerogamic flora is angiospermous, with about three as many dicotyledonous as monocotyledonous plants. The gymnosperms are only about 0.25 per cent. of the species of the flora. Its largest families are (in the order of number of species)—*Compositæ*, *Gramineæ*, *Cyperaceæ*, *Cruciferae*, *Papilionaceæ*, *Rosaceæ*, *Personatæ*, *Ranunculaceæ*, *Umbelliferae*, *Alsnaceæ*, *Labiatae*, and *Orchidæ*, the first-named being represented by 160, the last named by 38 species. The number of families represented amounts to 99. The largest genera of the flora is *Carex*, with 88 species. More than 250 genera are represented by only one species each. The whole number of phanerogamic species now known in Sweden is 1475. Of these only a very small number can be supposed to have originated in the country, the greatest number have immigrated from the south or east after the Glacial period, or have been introduced in one way or another by man. Among the immigrated species about 400 are more or less generally spread over the polar countries of the present period, or are to be found in southern countries as alpine plants. The great mass of these Glacial plants, the earliest inhabitants of the country, are confined to the northern part of Sweden, a smaller number are also to be found, or are only to be found, in the south and in particular localities, a larger number—about 70 species—are abundantly distributed over the whole country.

The Glacial plants were followed and superseded partly by sub arctic or subglacial species. Of these the Swedish flora has about 300, of which 50 are abundantly spread over the country, and 50 are pretty generally and abundantly distributed. The principal mass of the remaining species of the flora have immigrated in the same period as the oak, and have spread over the country south of Dal Elf, or also to the provinces immediately to the north of this river, some are outlying steppe plants, some have entered with the beech, the last immigrated forest tree of Sweden, and a small number of species, now limited to the west of the country, have possibly entered during a period before that of the beech, when the climate was warmer and moister than at present. (F. K.)

Fauna.—After the close of the Glacial period a twofold immigration of animals occurred,—from the south west through Denmark, and from the north east through Finland. Of the existing fauna, many species are widely spread. Especially in the north we find boreal circumpolar forms (wild reindeer, glutton, arctic fox, ptarmigan, several birds of prey, *Grallæ*, and aquatic birds). Others, such as the bear, the wolf, the fox, the magpie, &c., are to be found only in the Old World, but are represented in America by forms resembling them so much as to be regarded by many as only local varieties. Many of the commonest species, e.g., the squirrel, the woodpeckers, the crow, most of the singing birds, &c., though wanting in the New World, are distributed over Europe and parts of northern Asia.

Besides these we find also specially eastern, southern, and western forms, which have immigrated from widely separated regions. Thus, the northern hare, *Lepus timidus*, properly an inhabitant of Russia and Siberia, but also to be found in the mountainous tracts of central Europe, is common in most parts of Sweden, while the European hare, *Lepus europæus*, which is spread over central and western Europe, and is also to be found in Denmark, is wanting. Most of the field mice, and many birds which have an exclusively eastern range, have immigrated from Siberia. Among mammals, which nearly all belong to Europe, may be mentioned the roe deer and the red deer, the dormouse and the hedgehog, the last named is common in central and southern Sweden. The elk is considered to have immigrated from the south.

Not very long ago the bear, lynx, and wolf were common in all the forests of northern and central Sweden, but their number has rapidly decreased during the last fifty years. The bear is now confined to the wildest mountain and forest regions of Norrland and Kopparberg lan. The wolf was formerly common throughout the country, and between 500 and 600 were killed annually fifty

years ago. Now the number is only 30 to 40, and it is to be found almost exclusively in the mountain regions of Norrland. The lynx is also being exterminated, it is still found in the greater part of northern and central Sweden, at least as far south as Lake Vener. On the other hand, foxes have of late increased, at least in certain parts of the country, and are common everywhere. The glutton also is by no means rare in the mountain regions of Lapland. The destruction of cattle caused by herds of prey, especially in the north, is not inconsiderable, the loss being estimated at about 2500 reindeer and from 9000 to 10,000 sheep and goats annually.

Not without influence on the number of the smaller beasts of prey are the singular migrations of the mountain LEMMING (*Lepus*), which has its home on the higher mountains above the tree limit, whence in certain years it migrates in countless numbers to the lower forest regions and lowlands, doing great damage to the vegetation wherever it goes. After the last migration in 1883 the number of the foxes was found to have increased in the regions through which the lemmings had passed.

Of edible game the elk holds the first place. It has increased in numbers and range of late years, and is pretty common in the forest tracts of central Sweden. The roe deer, which has its proper home in the southernmost parts of Sweden, has also increased of late, and has been seen as far north as Örebro län and Västmanland. Hares occur in great abundance. Seals are found round the coast, they are hunted chiefly in the Baltic and the Gulf of Bothnia. Besides the larger beasts of prey, martens, weasels, otters, and squirrels are hunted for the sake of their skins, but not to any great extent. The beaver is now probably extinct. Some of the mammals (the bat, hedgehog, dormouse, badger, bear) hibernate, most of the other animals are in winter covered with a thicker coat of hair, and some change their colour to white or grey.

The wood-grouse is the most valued winged game. Its favourite haunt is the great lone forests. Although it has been obliged to retreat before advancing cultivation, it is still pretty common in suitable places. More numerous and almost as much liked is the black grouse, which has somewhat the same distribution as the wood grouse, but is less particular in the choice of its abode. In the forests of central and especially of northern Sweden the hazel grouse is numerous in many places, and on the mountains above the tree limit the ptarmigan is common everywhere. In the birch and willow regions we find the willow-ptarmigan, which above the snow line is superseded by the common ptarmigan. In winter a great deal of game is exported from Norrland to the southern provinces. The partridge, probably introduced about 1500, with difficulty endures the rude climate of Sweden, and great numbers often perish in winter for want of food. Still it is distributed all over southern and central Sweden as far north as Jämtland, and of late its numbers have increased. The number of woodcock and snipe is, like that of *Gallus* in general, decreasing. Numerous sea fowl are found on all the coasts. Some are killed and eaten, but as a rule they are not much relished. Their eggs are collected for food by the inhabitants of the seaboard. The eider-druck is common on both coasts. Among the birds of prey the hawk is the most destructive and the most hunted. The gyrfalcon and the golden eagle are found in Norrland and Lapland, and the sea eagle throughout the country, especially on the coasts. Some kinds of falcons and owls are very common, the latter especially in northern Sweden. In the interior the most characteristic birds are swallows, sparrow, the birds of the crow family, and the singing birds, among which the lark, the chaffinch, the thrushes, and the many species of *Sylvia* are most noticeable. The northern night-gale is rare in southern Sweden. The cuckoo is heard everywhere, especially in the forest regions. The mute swan is found in great numbers in a few places in southern and central Sweden. The whooper swan frequents the marshes and lakes of Lapland. The white stork is found in Skåne and Halland, and herons are found in great numbers here and there in Skåne and Blekinge. Cranes are distributed all over the country. Characteristic of the wild forest tracts of Lapland is the Siberian jay. Upwards of 250 species of birds may be considered as belonging to the Swedish fauna, most of them birds of passage, scarcely 40 remaining over winter in their summer resorts. In spring and autumn Sweden is visited by great flocks of the birds of passage of the extreme north, especially geese and snipe.

The reptiles and amphibians are few (3 snakes, 3 lizards, 11 batrachians).

Fishes. The Swedish rivers and lakes are generally well stocked with fish. The objects of capture are chiefly salmon, eel, pike, different species of perch, burbot, and several species of the *Salmonidae* and *Cyprinidae*. The annual income from the fisheries in the lakes and rivers amounts to upwards of £135,500, of which the salmon fisheries alone yield £42,000. Of still greater importance, of course, are the sea fisheries. In the end of last century the herring fishery in the "skärgård" of the west coast was the most important in Europe, and it is estimated that in one year 1500 millions of herrings were taken. Somewhat later, however, the great shoals disappeared for a long time. In 1877 a new era began in the his-

tory of the west-coast fisheries, the take that year being 1,230,000 cubic feet. Since then the herring has returned every year in greater or smaller numbers. There are also captured on the same coast flat fishes and cod fish, mackerel, and sprats. The annual produce of the sea fishery of the south and west coasts is valued at about £111,000. A smaller variety of the herring is found in great abundance on the east coast. In the Sound it is still 11 inches in length, in the Baltic only 6 or 8 inches. This variety is called "strömming," and is the object of an important fishery, annually bringing in more than £175,000. About 140 kinds of fishes are constantly found in Sweden or along its coasts. Of these nearly 100 belong exclusively to the sea, and upwards of 10 are to be found both in salt and fresh water. The remainder are properly freshwater fishes, but many are found in the brackish water of the Baltic coasts. Here we find perch, pike, &c., by the side of purely saltwater fishes, as the "strömming," the flat fish, &c.

The species of Scandinavian insects number at least 15,000. Notorious among these are the Lapland gnats. The "skärgård" of the west coast has a rich fauna of lower marine animals, partly forms of boreal and arctic descent, partly immigrants from the south. The Royal Academy of Science has here a zoological station, Kristineberg, for the purpose of scientifically examining the marine fauna.

Compared with the fauna of the west coast, that of the Baltic is extremely poor. It consists partly of European boreal forms, which have immigrated from the west, partly of freshwater forms, which have been able to live in the brackish water. But other types also occur, which, though sparingly represented, are of the greatest interest to the naturalist,—namely, certain dwarfed forms,—two or three species of fishes, some crustaceans and other lower marine animals, belonging to a purely arctic fauna, which have immigrated when the Baltic during a part of the Glacial period communicated with the White Sea. They are wanting on the south and west coasts of Sweden, but are found in the Arctic Ocean. Some of them, the four horned cottus and some crustaceans, are found in Lake Vetter and some other lakes of central Sweden, whither they had come when these lakes formed part of the arctic sea, they have since been shut in and have survived both the climate and the altered composition of the water. The arctic "vikare" seal (*Phoca hispida*), which is common in the north part of the Baltic but is not found on the west coast, and which is also found in Lake Ladoga, Lake Onega, and some lakes of Finland, is also considered as a survival of the fauna of the Glacial period. On the west coast lobster and oyster fisheries are carried on, the former being very productive. The common mussel is abundant, but in Sweden is only used as bait for fish. The crayfish is common in many places in central and southern Sweden. Pearls are sometimes found in the freshwater mussel *Margaritana margaritifera*, which is met with all over the country. (A. W.)

Extent and Population.—Sweden takes rank among the larger Area and countries of Europe. It contains 170,712.60 English square miles, population of which area 3,517,200 square miles are occupied by the large lakes Vener, Vetter, Malar, and Hjelmvar, leaving 167,195.31 square miles, distributed among the counties as shown in the following table, which gives the areas and the estimated population in 1885 of the different administrative divisions (the capital Stockholm and the twenty-four "län" or counties) into which the kingdom is divided.—

Län	Square Miles	Population
Stockholm (city)	12.65	215,688
Stockholm (rural)	3,008.45	148,841
Upsala	2,052.75	116,406
Södermanland	2,630.64	150,032
Östergötland	4,272.88	267,842
Jonköping	4,440.51	197,802
Kronoberg	3,841.51	166,881
Calmar	4,480.06	240,507
Gotland	1,202.97	52,570
Blekinge	1,164.00	140,071
Christianstad	2,506.97	226,787
Malmöhus	1,847.02	355,178
Halland	1,890.45	136,973
Göteborg (Gothenburg)	1,042.51	281,001
Elfsborg	4,948.15	282,835
Skaraborg	3,283.13	253,467
Värmland	7,345.73	250,958
Örebro	3,502.88	182,513
Västmanland (Vesterås)	2,623.14	182,046
Kopparberg	11,420.8	194,201
Gällborg	7,418.70	191,223
Västernorrland	9,510.92	184,884
Jämtland	19,608.5	93,091
Vesterbotten	21,942.4	113,541
Norrbotten	40,315.5	96,241

The population has long been steadily increasing. In 1750 it amounted to 1,763,368, in 1800 to 2,347,303, and in 1850 to 3,482,541. The census of December 31, 1880, returned the number as 4,565,668 (2,215,243 males, 2,350,425 females), and at the end of 1885 the population was estimated at 4,682,769 (2,278,861 males, 2,408,908 females).

It will be seen that Sweden is sparsely peopled (the average for the whole country being only 28 inhabitants to the square mile), and that the population is very unevenly distributed.—Malmöhus län, which lies farthest south, counting 193 persons to the square mile, whereas Norrbotten, farthest to the north, and by far the largest county, has only 2 4.

The urban population as late as 1884 amounted to only 777,857 (the rural amounting to 3,866,591). The towns are in general small. Except Stockholm (215,688 inhabitants in 1885), only five towns—Göteborg (91,033), Malmö (44,532), Norrköping (28,503), Gäddede (20,753), and Uppsala (20,202)—had in 1885 more than 20,000 inhabitants.

ital statistics The average number of marriages per 1000 inhabitants was for each of the years 1751–60 9.09, this proportion has gradually diminished since, having been 7.60 in 1851–60 and 6.81 in 1871–80. The yearly average of living children born from 1871–80 was 133,780, and the yearly average of deaths 80,140. The yearly average of deaths to 100 inhabitants for 1751–1815 was 2.71, this number has since been almost constantly decreasing, the average for 1851–60 being 2.17, and for 1871–80 1.82. Immigration and emigration till comparatively recent times had little influence on the numbers of population, but the latter years of the decennial period 1860–70 caused a change in this respect. The number of emigrants, which as late as 1867 amounted to little more than 9000, increased during 1868 to 27,000 and during 1869 to 39,000. During the years that followed there was a considerable decrease, but towards 1880 the number of emigrants again rapidly increased, and in 1882 this amounted to upwards of 50,000. The figure for 1884 was 23,560. Immigration, on the contrary, continues to be insignificant. The annual average of immigrants for 1875–84 was 3333.

race. The inhabitants of Sweden belong almost exclusively to the Scandinavian race. The principal exceptions are the Finns (in 1880 about 17,000), who chiefly inhabit the north eastern part of the county of Norrbotten, the Lapps (in 1880 about 6400), spread over an area of about 44,000 square miles in Lapland and Jämtland, and the Jews (in 1880 about 3000).

Agriculture.—Agriculture is the principal industry in Sweden. The number of persons gaining their livelihood by this occupation and those immediately depending on it was 2,342,000 in 1880, and the value of the harvest in 1884 was estimated at about £25,500,000 sterling, of which the grain harvest made £14,800,000. From 1840 to 1880 the export of grain (including meal, &c.) exceeded the import, but this has not been the case since 1881, while, on the other hand, the export of dairy produce has meanwhile increased.

Mines.—Sweden is rich in minerals, especially iron-ores, and the Swedish iron is celebrated for its good quality. In 1884 526 iron mines were worked, the joint produce of which amounted to 922,310 tons. The manufacture of cast iron amounted to 416,958 tons, that of bar iron to 267,534 tons, of steel to 66,329 tons, and of hardware to 43,226 tons. The copper during the same year amounted to 650 tons, and the silver to rather more than 4000 lb. Pitt coal has been found only in Malmöhus län, and even there in small quantity compared to the consumption of the country. The produce of the coal mines was in 1884 not more than 7,277,000 cubic feet, whereas the import of coal amounted to 52,650,000 cubic feet.

Forests.—A great part of Sweden is, as was above mentioned, covered with forests. Most of these are the property of private persons or joint-stock companies, but the Government also possesses large forests, the value of which was in 1884 estimated at about £2,400,000. The forest produce ranks among the principal articles of export from Sweden.

Manufactures.—It was not till 1854 that Sweden completely broke with the pre-existing protectionist system and adopted the principles of free trade. Since 1860 there has been no prohibition, and import duty is in general low. The value of the manufactures, which as late as 1850 was estimated at only £2,000,000, was for 1883 computed at more than £10,600,000.

Commerce.—The united value of the exports and imports of Sweden was estimated for 1850 at little more than £4,000,000, whereas in 1884 it was something over £31,000,000 (imports about £15,000,000, exports about £13,000,000). The principal articles of export were—timber and wooden wares, £5,747,000, metals and hardware goods, £2,667,000, grain (including meal, &c.), £1,307,000, animal food, £1,081,000, live animals, £652,000, paper and stationery, £584,000. The principal articles of import during the same year were—cotton and woollen manufactured goods, £3,012,000, colonial products (coffee, sugar, &c.), £2,309,000, grain and meal, £2,258,000, minerals (principally coal), £1,479,000,

metals and hardware goods, £1,308,000, cotton, wool, &c. £1,125,000, animal food, £1,086,000, ships, carriages, machines, instruments, &c., £807,000, hair, hides, bones, horns, and other animal substances, £784,000, tallow, oils, tar, gums, and similar substances, £782,000. The aggregate burden of vessels entering from and clearing to foreign ports was 858,827 tons in 1850, 5,388,085 tons in 1884. The estimated value of the exports to the United Kingdom during 1884 was £6,229,000, to Denmark £1,848,000, to France £1,073,000, to Germany £1,008,000, and to Norway £604,000, while the imports from Great Britain and Ireland reached £4,952,000, from Germany £4,947,000, from Denmark £2,932,000, from Russia and Finland £1,881,000, and from Norway £1,225,000.

Railways, Posts, and Telegraphs.—The length of the railways in Sweden is very great in proportion to the population. In 1884 the total length was 4194 miles, of which 1437 miles belonged to the Government and 2657 to 76 private companies. The postal system is remarkably well organized. In 1884 the number of post offices was 1965, through which 46,533,627 inland letters, post cards, post-office orders, newspaper and book packets, &c., were forwarded, and 5,507,770 to and 6,511,248 from foreign countries. The telegraph system is also in a very flourishing condition. The total length of the telegraph wires in 1884 was 12,969 miles, and the number of messages forwarded was 1,178,959.

Education.—With regard to education Sweden occupies a very prominent place. Primary education is compulsory for all the children of the country, and this principle is so strictly applied that in 1884 out of 733,829 children of school age only 15,143 were not under tuition. To supply this primary instruction there are 9925 national schools of different kinds, with 5216 male teachers and 6832 female teachers (1884). For higher educational purposes there are 98 public schools (1885), of three grades, with 14,617 pupils, and two universities (Uppsala with 1821 and Lund with 827 students). In Stockholm there is, besides, a medical faculty, the Royal Caroline Medical-Chirurgical Institution. A free university is in course of formation, for which large sums have been given by private persons. There are a large number of Government schools for the military and naval services, for the technical sciences, for metallurgy, agriculture, nautical science, and for the blind and the deaf and dumb. All instruction at the national schools, the public schools, and the universities is free.

Religion.—Christianity was introduced into Sweden about the ninth century, and was generally professed by the twelfth. The country adopted the doctrines of the Reformation during the reign of Gustavus Vasa. The national church, established by the resolution passed at Uppsala in 1593 (*Uppsala möte*), is Lutheran. The country is divided into 12 bishoprics (*stift*). The bishop of Uppsala is archbishop of Sweden. In 1880 the number of dissenters was 21,234, of whom 14,627 were Baptists, 2993 Jews, 1591 Methodists, and 810 Roman Catholics.

Army and Navy.—The land defences consist partly of a standing army, partly of a militia. The former (about 40,000 men) is for the most part founded on the "indelningsverk," an institution dating from the time of Sweden's greatness, which makes the soldier a settled farmer. The militia comprises (since 1885) all males between twenty one and thirty two years of age.

The navy, with a permanent personnel (also for the most part Navy founded on the "indelningsverk") of rather more than 7000 men, consists principally of coasting vessels.

The budget for 1887 gives the revenue and expenditure as follows: £4,713,000. The national debt, contracted wholly for railways, is about £13,600,000.

Constitution.—Sweden is a limited monarchy. Its constitution, like that of England, rests on an historical development of several centuries. From the earliest times the people governed themselves through elected trustees, made laws and levied taxes, while the king was little more than their leader in war. By and by the power of the king was extended, and alongside of it there arose a class of great men, who certainly lessened the legal rights of the lower orders, but who never succeeded in completely subduing them. Through Engelbrecht the burghers and yeomen regained their influence on the development of the state, and their deputies were summoned to the riksdag (1435). Gustavus Vasa and his son Charles IX stripped the nobility of the high authority they had exercised during the latter part of the mediæval period, and which had been dangerous both to the power of the king and to the people, and so saved the work of Engelbrecht. The right of the lower classes to be members of the riksdag was confirmed by the first "Riksdagsordning" ("law for regulating the riksdag or parliament") of Sweden (1617),

which for the first time legally regulated the system of four houses formerly adopted. In the 16th century the nobility, having been endowed with extensive domains by the crown, again won an ascendancy that was very dangerous to the lower classes, but it was crushed when Charles XI, by the diminution of their property (1680), for ever put an end to the supremacy of the nobility and the council in the state. By this act the power of the king was greatly strengthened, so much so as to endanger even the most essential rights of the riksdag,—those of giving laws and levying taxes. But after the death of Charles XII the despotic system was abolished, and all power was lodged in the hands of the riksdag by the constitutions of 1719 and 1720. During the following period, which is called “the time of liberty,” it was the riksdag that had the function of appointing and dismissing the councillors of state, and by this means was able to dominate the administration so completely as to make the power of the king of little more significance than an empty word. Different political parties defeated each other, and sold their services to foreign states without any regard to the interests of their own country. This state of affairs, which might eventually have proved exceedingly disastrous, was altered by a revolution effected by Gustavus III (1772) which restored to the king his former power. In the new constitution, however, neither the authority of the king nor that of the people was clearly limited, and this soon led to collisions by which the king succeeded in considerably increasing his ascendancy (1789), though he cannot be said to have gained despotic power. Gustavus IV, however, abused his great authority, so that he was dethroned by a revolution. New constitutional laws were now made, in which, guided by the experience of former times, an effort was made clearly to define the respective powers of the king and the representatives of the people, to prevent encroachment from either side. The effort was crowned with success, and the new constitution of June 6, 1809, is still in great measure in force. The old division, however, into four houses has been abolished, and the influence of the representatives of the people has been increased by the new Riksdagsordning of 1866. The other constitutional laws are the “Successionsordning” (“law of succession”) of 1810 and the “Tryckfrihetsordning” (“law regulating the liberty of the press”) of 1812.

The executive power is vested in the king alone. The legislative power he shares with the riksdag, both parties having the rights of initiative and veto. The king has, besides, a legislative power, not precisely defined, in certain economic matters. The right of levying taxes belongs to the riksdag alone, but the king may in certain cases (as, for example, through his right of lowering the custom duties) exercise a certain influence. He can declare war and make peace, and has the supreme command of the army.

The king is irresponsible, but all his resolutions must be taken in the presence of responsible councillors (“statsråd”). These, who form the council of state, are ten in number, of whom seven are also the heads of departments of the administration (justice, foreign affairs, army, navy, internal affairs, finance, and ecclesiastical affairs, including both church and schools). For the advice they give the councillors of state are responsible to the riksdag, which receives the record of their proceedings through an annually appointed board, which has power also to indict the councillors before a special tribunal, the “riksrätt,” formed for the occasion, of which certain high functionaries have to be members. One of the councillors of state is, as prime minister, the head of the administration.

The riksdag meets every year on January 15, and consists of two houses. The members of the first house,

one for every 30,000 inhabitants (143 in 1887), are elected by the “landsting” in the counties, or by the municipal councils of the larger towns, for a period of nine years. They receive no payment. Any Swede is eligible who is at least thirty-five years of age, who possesses, and for three years before the election has possessed, real property to the value of 80,000 crowns, or who, during the same period, has paid taxes on an annual income of 4000 crowns. The members of the second house (one or two for every district of judicature in the country, according as the population exceeds or falls short of 40,000, and one for every 10,000 inhabitants in the towns) receive a salary of 1200 crowns, and are elected for a period of three years by electors, or directly, according to the resolution of the electoral district. If a member retires during that period, his successor is elected for the remainder of the three years, and thus the house is wholly renewed at regular intervals, which is not the case with the first house. The franchise is possessed by every one who owns landed property to the value of 1000 crowns, or who has farmed for at least five years lands worth 6000 crowns, or pays taxes on an annual income of 800 crowns. All electors are eligible. The number of electors is about 65 per cent of the population. The towns elect their representatives separately. Both houses have in theory equal power. Before bills are discussed they are prepared by boards, whose members are elected by half of each house. When the houses differ on budget questions, the matter is settled by a common vote of both houses, which arrangement gives the second house a certain advantage from the greater number of its members. By revisers elected annually the riksdag controls the finances of the kingdom, and by an official (“justitieombudsman”) elected in the same way the administration of justice is controlled, he can indict any functionary of the state who has abused his power. The bank of the kingdom is superintended by trustees elected by the riksdag, and in the same way the public debt is administered through an office (“Riksgäldskontoret”), the leader of which is appointed by the riksdag.

Administration, Law, and Justice.—The administration consists partly of a centralized civil service, arranged under different departments, partly of local authorities. Each of the twenty-four counties has a governor (“landshövding”) who presides over the local offices (the “landskansli,” the “landskontor”), and is assisted by subordinate local officers (“kronofogdar,” “häradskriftare,” “länsmän”). There is, moreover, in each county a representation (the “landsting”), elected by the people, that deliberates on the affairs of the county and has a right to levy taxes. Each county is divided into parishes, which, like the towns, have a very strong communal self-government. The law of Sweden dates from 1736, but it has of course undergone a great many alterations and additions, the most important being the new penal law of 1864. Justice is administered by tribunals of three instances—(1) the “häradsrätt” in the country, consisting of a judge and seven to twelve assessors elected by the people, who, if they are unanimously of an opinion different from that of the judge, can oust him, and the “rättsutskott” (boards of magistrates) in the towns, (2) three “höfrätt” (higher courts) in Stockholm, Jönköping, and Christianstad, and (3) the royal supreme court, which passes sentence in the name of the king, and two members of which are present in the council of state when law questions are to be settled, this tribunal has, moreover, to give its opinion upon all proposed changes of the law. A jury is never summoned in Sweden except in cases affecting the liberty of the press.

Union with Norway.—Sweden has been united to Norway since 1814. The union is regulated by the “Rikssakt”

of 1815, according to which each country is free and independent, though both are governed by the same king. The connexions of both countries with foreign states are regulated by the Swedish minister for foreign affairs, but when the king has to settle matters concerning foreign states which also are of importance to Norway a Norwegian councillor of state has to be present. Both countries have the same ambassadors and consuls abroad, and share the expenses of their support, Sweden bearing the larger part of this outlay. In war the two countries are bound to assist each other. Thus the union is what is called a "unio realis."

(J F N)

PART II—HISTORY

From the earliest times of which we have any authentic information there were in Sweden two more or less distinct peoples,—the Gota or Goths in the south, and the Svea or Swedes in the north. They spoke similar languages, were of the same Teutonic stock, and had like customs, institutions, and religious beliefs, but these facts did not prevent them from regarding one another with jealousy and dislike. The most powerful king among these peoples was the king at Upsala. There were other chiefs or kings, called in later times *smaa-kongar*, but they recognized the superiority of the Upsala king, whose peculiar position was due to the fact that there was at Upsala a great temple of Wodan, which was held in equal reverence by the Swedes and the Goths. Upsala was in the territory of the Swedes, and we can account for the feeling of the Goths with regard to it only by supposing that they were an offshoot from the Swedes, and that the worship of Wodan was in some special way associated with Upsala before the separation took place. Of the two peoples, the Goths seem to have been most active and open to new ideas. They spread along the southern coasts of Sweden and among the islands of the Baltic, and there can be little doubt that the Goths in Germany and Russia, who played so great a part in the disruption of the Roman empire, sprang from the Swedish Goths.

Slavery was not unknown in ancient Sweden, but it did not form an important element in social life. The vast majority of the people were free. They were divided into two classes, *jarls* and *bondar*, corresponding to the Anglo-Saxon *eorls* and *ceorls*. The *bondar* were the landed freemen, while the *jarls* were of noble blood. In some remote age the land may have been held in common by village communities, but in historic times there has always been in Sweden private property in land as well as in movables,—the *jarls* having wider lands than the *bondar*, and some *bondar* being better off than other members of their class. The kings were treated with much respect, for they belonged to families which were believed to be descended from the gods, but their power was far from being absolute. When a king died, his authority did not necessarily pass to one of his sons, the freemen chose as his successor the member of the royal family who seemed to them best fitted for the duties of the office. The king's power was limited not only by the fact that he was elected but by the rights of the freemen in all matters concerning life and land. At regular times moots were held for legal, legislative, and political purposes, and without the sanction of the Great Thing, as the tribal assembly was called, no law was valid and no judgment good.

Besides the Great Thing, of which all freemen were members, there were local things, each attended by the freemen of the district to which it belonged. The chief function of these local assemblies was to settle disputes between freemen, their decisions being given in accord-

ance with rules based on ancient customs. Very often their judgments could not be enforced, and here, as in other Teutonic lands, the impotence of the local popular courts was one of the causes which led to the growth of the king's authority. He was bound to go round his land in regular progress, doing and enforcing justice among his subjects, and in course of time men felt more and more strongly that the best way of obtaining redress for serious grievances was to appeal directly to him.

As far back as we can go in Swedish history we find that the principal aim of the Upsala kings was to get rid of the *smaa-kongar*, and to put royal officers in their place. These officers ruled in the king's name in association with the local things, but their tendency, especially in times of great civil commotion, was to make themselves as independent as possible. The king himself was always attended by some of the leading magnates, who formed a sort of council of state, and with their aid he prepared the plans which were afterwards submitted to the Great Thing. Although the Great Thing never ceased to be in theory an assembly of the nation, it gradually lost its primitive character, the political rights of the common freemen being usurped by the nobles, who sought also to hamper the exercise of the royal authority.

According to the *Ynglinga Saga*, in which bits of old Swedish legends are preserved, the first Upsala kings were Ynglingar, sprung from Yngie Frey, the grandson of Wodan. We are told that the last representative of this dynasty was Ingvald Illrede, that he slew six of the *smaa-kongar*, and that he afterwards killed himself when he heard that the son of one of the murdered chiefs was advancing against him. It is said that the Ynglingar were succeeded by the Skjoldungar, who claimed to be descended from Skjold, Wodan's son, and the traditional account is that this line began with Ivar Vidfadme, and that he not only became king at Upsala but conquered Denmark, a part of Saxony, and the fifth part of England. Another of the Skjoldungar, Eric Edmundsson, is said to have been an even greater king than the founder of the dynasty. During this legendary period, kings in Sweden were often at war with kings in Norway and Denmark, and Swedish adventurers undertook many warlike enterprises against the Finns and the Wends. While Danes and Norwegians were founding states in the British Islands and France, the Swedes were accomplishing like results on the eastern shores of the Baltic.

At this early period Sweden did not take in all the territory which now belongs to it. Scania, one of the most fruitful and prosperous districts of modern Sweden, had been from time immemorial an independent and comparatively powerful Gothic state. In the 9th century it was annexed to Denmark by King Guthrun, and, although in later times it was often a subject of bitter dispute between Denmark and Sweden, its connexion with the former country was not finally severed until the 17th century. Lund, the principal town in Scania, was for many generations the see of the primate of the Danish church.

The scattered notices of Adam of Bremen, Saxo, and certain saints' lives, with a few allusions elsewhere, are our direct written sources for this early period. They may be eked out by study of the laws and of local nomenclature. Later the rich runic remains of Sweden give us some fuller help. After the end of the 10th century the evidence gradually becomes clearer and more trustworthy. There was then at Upsala a powerful king called Eric the Victory-Blest. He defeated a band of vikings in a great battle at Fyrisval, and, according to Adam of Bremen, had for some time complete control over Denmark. He was succeeded in 993 by his son Olaf Olaf

(993-1024), who was called the Lap-King because he was a child when his reign began. Olaf was baptized about the year 1000, and was the first Christian king of the Swedes. In the 9th century St Ansgar had laboured for some time as a missionary in Sweden; but without much success. Even Olaf, who was supported in his efforts by Siegfred, the devoted English missionary from whom he had received instruction in Christian doctrine, found that it was impossible to convert the majority of his subjects. He was allowed to build churches in West Gothland, but in the rest of his dominions the people clung obstinately to paganism. During his reign there was war between Sweden and Norway, and Olaf seems to have been in favour of carrying on the struggle with vigour. His people, however, desired peace, and it is related that at the Great Thing at Upsala they threatened to take his life if he did not give Olaf, the Norwegian king, his daughter in marriage. He consented to do as they wished, but broke his promise, and he would probably have been set aside had it not been for the mutual jealousy of the Swedes and the Goths.

The Lap-King was succeeded, one after the other, by his sons Anund and Edmund the Elder, and under their rule the church lost much of the ground which it had gained through the efforts of Olaf. After Edmund the Elder's death the Goths resolved that Stenkil, the Christian jarl of West Gothland, should be made king. This decision was resisted by the Swedes, but the result of the civil war which broke out was that Stenkil was able to maintain his claim. He reigned from 1056 to 1066, and effectually protected the church without attempting to do violence to the convictions of the pagan population. His reign was followed by a period of much confusion, during which the Goths and the Swedes treated each other as enemies,—the latter upholding paganism, the former contending for Christianity. Under Inge the Elder, who reigned from 1080 to 1112, the temple at Upsala was burned, and from this time there could be no doubt as to the ultimate triumph of the church, which was served with heroic courage by many zealous foreign missionaries. So much progress was made that Swerker Karlsson, who reigned from about 1135 to 1155, begged the pope to give the Swedish people bishops and a primate. Nicholas Breakspear, the English cardinal who was afterwards raised to the papacy as Adrian IV, was sent to make the necessary arrangements. He found that the Swedes and the Goths could not agree as to a place for the see of a primate, but at a synod which met at Linköping in 1152 it was decided that the Swedish clergy should accept the law of celibacy, and that Sweden should pay a yearly tax to the pope. For a long time many pagan ideas and customs survived, but Sweden was now, at least nominally, a Christian country.

Eric
Ldwards
son.

When Swerker was murdered in 1155 the Goths wished to make his son king, but the Swedes chose Eric Edwards-son, and he reigned until 1160. Eric was so good a king that after his death he was canonized by the popular voice, as was then the way in the North. Upsala was made by him a primate's see, and he began the series of efforts which led to the annexation of Finland to Sweden. Finnish pirates had often desolated the Swedish coasts, and it had become absolutely necessary that their country should be subdued. Eric not only overcame the Finns, but did what he could to compel them to accept Christianity.

For about a century after Eric's death the Goths and the Swedes were almost constantly at war with one another, each people choosing its own king. The Goths preferred the descendants of Swerker, while the Swedes were loyal to the descendants of Eric, who were known as

the yeomen-kings, because Eric had originally belonged to the class of bondar or yeomen. The Danish kings often aided one or other of the contending parties, and as a rule they seem to have done far more harm than good by their interference. To some extent the church maintained among the people a sense of national unity, but it was not powerful enough to give much protection to the poorer members of the community against the despotism of local magnates. In the end, when the church itself became rich, the higher clergy were quite as tyrannical as the secular nobles.

John Swerker-son, the last king of the Swerker dynasty, died in 1222, Eric the Halt, the last of the yeomen kings, in 1250. In the latter year the crown was given to Waldemar, whose mother was a sister of King Eric the Halt. Waldemar belonged to the Folkungar family, which had acquired great estates and risen to a position of high importance in the state. Under this dynasty the Goths and the Swedes gradually ceased to be jealous of one another, and became a thoroughly united people. From this time civil troubles in Sweden sprang, not from the antagonism of rival peoples, but chiefly from the increasing power of the great landowners, who strove incessantly to limit the rights of the free peasantry, and were often strong enough to defy the crown.

At the time of the death of Eric the Halt, Birger Brosa, Waldemar's father, was in Finland, where he conquered Tavastland and strengthened the hold of the Swedish crown over those tribes which had been already subdued. On his return to Sweden he was indignant to find that he had not himself been elected to the throne. He accepted what had been done, however, and devoted his energies to the promotion of his son's interests. Until his death Birger was the real ruler of Sweden, and the nation had never been governed by a man of stronger will or more upright character. If he did not actually found Stockholm, it was he who made it the strongest fortress in the country,—a service for which the Swedish people had good reason to be grateful to him, for it enabled them to put an end to the depredations of Finnish pirates. After the death of Birger great evils were brought upon the country by the folly and incompetence of Waldemar, who was at last driven from the throne and imprisoned by his brother Magnus, who succeeded him. Magnus (1279-1290) was a lover of pomp and splendour, and formed a more brilliant court than the Swedes had ever seen. He granted immunity from taxation to those landowners who should give the crown *ross-tjinst* or horse-service, that is, serve the king in war at the head of a body of horsemen. His intention in adopting this plan was to secure for the crown a powerful body of loyal and attached supporters, but, as the measure added to the wealth, dignity, and influence of the nobles, its ultimate effect was to weaken the royal authority. Although he increased the importance of the aristocracy, Magnus was not unmindful of the interests of the common freemen. He is known as Ladu-las or Barn-Lock, because he issued a law requiring persons of noble birth to pay for the straw and corn with which, when travelling, they might be supplied by peasants. Magnus was also a munificent benefactor of the clergy. He endowed a large number of churches and built five monasteries.

Magnus was succeeded by his son Birger (1290-1319). Birger was only nine years old when his father died, and for a long time the power of the crown was wielded by his guardian, Torkel Knutsson, a wise and vigorous statesman. Knutsson drew up a code of laws which was accepted by the Great Thing in 1295, and in Finland he not only put down rebellion but annexed Savolax and Carolia. In 1306, misled by his brothers Eric and Waldemar, Birger

caused this faithful and able counsellor to be beheaded, and the result was civil war, in which the weak king found it hard to make way against his restless and ambitious brothers. At last he got them into his power by treachery, and threw them into a dungeon of the castle of Nyköping, where they died of starvation. Soon afterwards Birger himself died, despised and hated by his subjects. He was succeeded by his nephew Magnus, his brother Eric's son, a child of about three years of age. Magnus's guardian, Mats Ketilmundsson, was a man of strong and noble character, and as long as his supremacy lasted the Swedish people were more prosperous than they had ever been before. Taking advantage of the troubled condition of Denmark, he joined Scania and the neighbouring districts of Halland and Blekinge to the Swedish kingdom, and had his prudent system of government been maintained these provinces might have been kept, for the inhabitants seem to have preferred Swedish to Danish rule. But, when he died in 1336, the king fell under the influence of unworthy favourites. Scania, Halland, and Blekinge were restored to Denmark, and Sweden was soon in a state of the greatest confusion. In 1363 a number of nobles who had given Magnus much trouble, and whom he had expelled from the country, went to his sister's son Albert, count of Mecklenburg, and offered him the crown. The offer was accepted, and afterwards Albert was formally elected by the Great Thing. Magnus resisted, but was defeated and made prisoner in a battle at Enköping in 1365. In 1371 he was released, and the rest of his days he spent in Norway, where he was not unpopular. From his mother he had inherited the Norwegian crown, but before the misfortunes of his later years it had been transferred to his son Haco.

Magnus

Albert.

The nobles and the hierarchy of Sweden were now so powerful that only a king of the highest political genius could have hoped to control them. Albert of Mecklenburg proved to be utterly unfit for the task he had undertaken. He tried to protect himself by giving many of the great offices of state to Germans, but he was warned that he would be dethroned if he continued to show so much favour to foreigners. In 1371 he accepted as his chief counsellor a great Swedish noble called Bo Jonsson, to whom about a third of the kingdom is said to have belonged. Bo Jonsson gave much more heed to his own interests than to those of his country, and did hardly anything to mitigate the hardships inflicted on the common people at this time by the turbulence of the well-off classes. After Bo Jonsson's death Albert attempted to regain some of the authority which he had been forced to delegate to his powerful minister, but the nobles refused to obey him, and invited Margaret of Denmark and Norway to take his place.

Margaret.

Margaret, one of the most remarkable figures in Scandinavian history, was the daughter of Waldemar IV of Denmark, and at an early age she had become the wife of Haco of Norway, son of the Swedish king whom Albert had supplanted. The offspring of this marriage was an only son, Olaf, who succeeded his grandfather in Denmark in 1375 and his father in Norway in 1380. Both countries were ruled firmly and wisely by Margaret in her son's name, and after his death in 1387 the Danes and the Norwegians begged her to retain supreme power. To this request she assented, and, when the Swedish nobles asked her to undertake the government of Sweden also, she at once expressed her willingness to attack Albert, who had irritated her by claiming the Danish crown. An army was soon despatched to Sweden, and in 1389 Albert was defeated and taken prisoner at Falköping. Stockholm, which was held by German mercenaries, refused to admit the conqueror, and for several years it was besieged

without success by Danish troops. At last the difficulty had to be settled by negotiation. In 1395 it was arranged that Albert should be set at liberty on condition that within three years he should pay a ransom of 60,000 marks. If at the end of that period the money was not paid, he was either to give up Stockholm or to return to captivity. The result was that in 1398 Stockholm was surrendered by the Hanseatic League, which had become security for the fulfilment of Albert's engagement.

Meanwhile Margaret had persuaded the Danes, the Norwegians, and the Swedes to accept her grandnephew Eric of Pomerania as her successor, and in 1397 he was crowned at Calmar. Margaret was eager that the union of the Scandinavian countries under a single sovereign should be made permanent, and delegates from the councils of state of the three kingdoms met at Calmar to discuss her proposals. On the 20th of July 1397 these delegates concluded what was called the union of Calmar. Sweden, Norway, and Denmark, while retaining their local laws and customs, were in all future time to be ruled by one king. When a king died he was to be succeeded by his eldest son, but if he were childless his successor was to be freely elected. In foreign affairs Scandinavia was always to act as a united country. Margaret had excellent intentions in devising this bold scheme, but the time was not ripe for so vast a change. It was inevitable that when popular movements were no longer held in check by her strong will, formidable difficulties should spring from the jealousies of the three nationalities.

Even after Eric's coronation Margaret remained the real Eric XIII sovereign, and she was powerful enough to make the union something more than a mere name. But even during her lifetime the Swedish people showed that they resented the idea of being taxed for objects in which they were only indirectly interested, and when she died (in 1412) it soon became evident that Eric would be unable to retain their allegiance. In 1386 Margaret had formally recognized the claim of Gerhard VI., count of Holstein, to be feudal lord of the duchy of Schleswig. Gerhard died in 1404, leaving three young sons. Margaret and Eric then tried to recover the rights of the Danish crown in the duchy, and in 1413, soon after Margaret's death, Eric caused Schleswig to be declared a forfeited fief. The result was a war which lasted about twenty years. The Swedes had to bear heavy burdens to enable Eric to carry on the conflict, and he made no attempt to allay their discontent. He seldom visited their country, and his officers often treated them with reckless cruelty. In the province of Dalecarlia the royal bailiff acted so tyrannically that in 1434 the people rebelled. They were led by a brave and patriotic miner, Engelbrecht Engelbrechtsson, and under his influence the movement spread rapidly among the peasantry of other districts. The Swedish council of state, alarmed by the enthusiasm he had excited, agreed in 1436 to declare the king deposed. The nobles were more afraid of the peasants than of Eric, and soon placed him on the throne again, but he never fully recovered his authority. He was obliged to make Charles Knutsson his viceroy in Sweden, and Knutsson was as anxious as Engelbrechtsson that Swedish independence should be restored. The two patriotic leaders became jealous of one another, and Engelbrechtsson was murdered by a member of Knutsson's party. But the popular agitation lost none of its original force, and in 1439 Eric was dethroned by all his kingdoms. He fled to the island of Gotland, where he lived for some years by piracy, and afterwards he was compelled to seek for refuge in Pomerania. Christopher of Bavaria, Eric's nephew, was elected to the Danish throne, and he was soon acknowledged also in tophet.

Norway and Sweden. He was a man of good intentions, but was not strong enough to overcome the prejudice created against him by the fact of his being a foreigner. When he died in 1448 the Danes chose Christian, count of Oldenburg, as his successor, and the Norwegians by and by followed their example. Had the decision in Sweden rested only with the nobles and the clergy, Christian would at once have received the Swedish crown, for under the nominal rule of a foreign king these classes were able to tyrannize as they pleased over their poorer neighbours. But the Swedish people generally so strongly disliked the union, and stood so urgently in need of the protection of a native sovereign, that Charles Knutsson was made king. He mounted the throne as Charles VIII. The aristocracy, both spiritual and temporal, detested him, and in 1457 he found in Archbishop Jons Bengtsson so formidable an enemy that he had to make his escape to Dantzic. Christian I of Denmark and Norway then became king of Sweden, but he was unable to assert supremacy over the country as a whole, and in 1464 Charles VIII again secured the throne. In the following year Charles was displaced a second time, but soon afterwards he was recalled, and he retained the crown until his death in 1470.

Charles
VIIISten
Sture
regent

Charles was succeeded, not as king but as regent, by his nephew Sten Sture, under whose firm rule Sweden became prosperous and contented. Sten Sture was a far-seeing statesman, and sided resolutely with the peasants against the nobles. He took great pains also to promote the intellectual culture of the people. The university of Upsala was founded by him, and he introduced into Sweden the art of printing, and invited to the country many foreign scholars. He was not able wholly to destroy the union, for in 1496 he was defeated by King Hans of Denmark and Norway, who afterwards received the Swedish crown. Nevertheless Sten Sture remained the real master of Sweden, and after the defeat of the Danes by the Dittmarshers in 1500 his power was almost absolute. He died in 1503, when his authority passed to his nephew Svante Nilsson Sture, whom King Hans and the Swedish clergy and nobles in vain attempted to put down. Svante Nilsson Sture was succeeded by his son, Sten Sture the younger, in 1512, and for some time this brave and patriotic regent vigorously held his own both against his enemies at home and against Christian II, king of Denmark and Norway. In 1520, however, he was mortally wounded in a battle with the Danes at Bogesund, after which Christian II became king of Sweden. This sovereign had some enlightened ideas, but he was a man of ferocious passions, and he had no sooner restored the union than he made the maintenance of it impossible by an act of almost unparalleled cruelty. Under the pretence of upholding the honour of the church he ordered at Stockholm the execution of ninety persons accused of having taken part in the deposition of his friend and supporter Archbishop Gustavus Trolle, who had been the late regent's bitterest enemy. Most of the condemned men were nobles, and Christian hoped that by killing them he would secure the allegiance of the peasantry. The whole Swedish nation, however, was shocked by so horrible a massacre, and resolved to shake off for ever the hated Danish yoke.

Christian
II

The movement for national independence was headed by Gustavus Ericsson, known afterwards as Gustavus Vasa. This young noble had been one of a group of Swedish hostages whom Christian II had sent to Denmark, treating them as if they had been prisoners of war. In 1519 he escaped from prison, and after a short stay in Lubeck found his way to Dalecarlia, where he went about in disguise among the peasantry, urging them to combine

against the common enemy. At first they were afraid to act with him, but their hesitation vanished when they heard of the blood-bath in Stockholm,—a crime by which Gustavus himself was more than ever embittered against the Danes, for his father was one of Christian II's victims. A force raised by Archbishop Trolle having been defeated, Gustavus led his troops beyond the limits of Dalecarlia and took Vesterås and Upsala, and laid siege to Stockholm and Calmar. These fortresses were bravely defended, but in 1523, with the help of a fleet sent to him by Lubeck, he succeeded in capturing them. In 1521 he had been declared regent, and in 1523, before the conquest of Stockholm and Calmar, he summoned at Strängnäs a diet which elected him to the throne. Soon afterwards he made himself master of Finland, and he annexed Scania, Halland, and Blekinge. The union had now been brought to an end, and from this time Sweden was always ruled by her own kings. Denmark and Norway, however, remained subject to one crown until the beginning of the 19th century.

Gustav
Vasa

Gustavus Vasa was by far the greatest sovereign who had up to this time ruled the Swedish people. Before he was made king the doctrines of Luther had been proclaimed in Sweden by the brothers Olaus and Laurentius Petri, and Gustavus, who listened attentively to their teaching, became one of the most enthusiastic adherents of the Reformation. He acted cautiously, however, and resolutely opposed violent agitators. The majority of the Swedes cordially accepted the new doctrines, and at a diet held at Westorås in 1527 Gustavus received authority to reorganize the church. Thus he did thoroughly, making it clear from the beginning that Protestant pastors would never be permitted to wield the power which the Roman priesthood had so often abused. The greater part of the vast estates which had belonged to the Roman clergy he confiscated and applied to the uses of the state. In his secular policy he was as bold and successful as in his dealings with the church. For centuries the independence and arrogance of the great nobles had been the curse of the Swedish people. Gustavus missed no opportunity of limiting their influence. He compelled them to bear their fair share of the public burdens, and secured for himself faithful allies by obtaining for burghers and the peasantry, who had lost almost all their political influence, a recognized place in the diet, which was now summoned more frequently and regularly than it had been for several generations. Gustavus did everything he could to encourage industry. For six years he fought with Lubeck in order to break the supremacy of the Hanseatic League, and he concluded treaties of commerce with England and the Netherlands. So many changes were effected in Sweden in his time that several conspiracies were formed against him, but he had little difficulty in overcoming his enemies, for he had the confidence and affection of the great mass of his subjects. In 1544 it was decided by the diet that the Swedish throne should cease to be elective, and that it should be hereditary in the family of Gustavus.

When Gustavus died in 1560, his eldest son Eric became king. Eric was foolish enough to go to war with Frederick II. of Denmark for no better reason than that the latter, like Eric himself, claimed the right to put three crowns in his coat-of-arms. This war, which lasted seven years, caused much suffering to both nations. The Danes were generally beaten at sea, but under the leadership of the stout soldier Daniel Rantzau they gained important victories on land. Intellectually Eric was one of the most cultivated of Swedish kings, but in action he was so headstrong and wayward that most people believed him to be insane. He wasted the treasure amassed by

Eric XIV

his father, and under the influence of passion and suspicion caused the death of many powerful and loyal subjects. In 1568 his brothers John and Charles rebelled against him. His favourite, Göran Persson, who was accused of having constantly misled him, was seized and executed, and Eric himself was obliged to surrender. He was deprived of the crown and kept in close confinement until 1577, when he was murdered.

John III. John mounted the throne as John III. (1568-1592)

Sigismund.

In 1570 the war between Sweden and Denmark was brought to an end by the peace of Stettin. Sweden obtained some advantages by this treaty, but she had to resign to Denmark her claims to the island of Gotland, and to Scania, Halland, and Blekinge. Through the influence of his first wife Catherine, sister of King Sigismund II. of Poland, John had become a Catholic, and as king he laboured to restore as far as possible the old religious forms. His efforts were bitterly resented by the Protestants, while at Rome he was condemned for not acting with sufficient decision in the interest of his church. He was succeeded by his son Sigismund, who had been elected king of Poland in 1587. In the interval between John's death and Sigismund's arrival in Sweden supreme power was exercised by Duke Charles, Sigismund's uncle. Charles, the ablest of all the sons of Gustavus Vasa, resolved to take advantage of the opportunity to place the ecclesiastical system of the country on a satisfactory basis. Accordingly a great assembly was summoned at Upsala in 1593, and by this assembly it was decreed that the Augsburg confession of faith should be accepted as the authoritative statement of the theological doctrines of the Swedish church. The decision was of vast importance, and the Swedes have ever since looked back upon it as one that marked an era in their national history.

Before his coronation in 1594 Sigismund undertook to protect the rights of his Protestant subjects, but, being an ardent Catholic, he soon began to work for the triumph of his own creed. On his return to Poland the discontent he had excited in Sweden found free expression, and he was obliged to place the administration of affairs in the hands of his uncle, Duke Charles. In the time of King John a dispute about frontiers had led to war between Sweden and Russia, and this war was still going on when Charles undertook his new duties. In 1595 he concluded peace, securing for Sweden the provinces of Esthonia and Narva, but yielding to Russia some districts on the borders of Finland. These districts were held by Klas Fleming, an enthusiastic adherent of King Sigismund, and he declined to give them up, nor were they surrendered until the death of this general in 1597. Meanwhile Charles had found that some members of the council of state were bent on thwarting all his schemes, and from them he appealed to the diet. The diet heartily supported him, and appointed him governor-general of Sweden, whereupon he set to work in earnest to put down Catholic intrigues, and to promote the interests of the peasantry in opposition to those of the great nobles. In 1598 Sigismund advanced against him with a Polish army, and was defeated at Stångebro, near Linköping. The war went on for some time, but Sigismund himself returned to Poland. In 1600 the diet demanded that he should reside in Sweden or send his son to be educated as a Protestant. No answer being returned to these demands, Sigismund was dethroned, and his heirs were deprived of the right of succession. Duke Charles was then made king, and reigned as Charles IX. Sigismund continued to regard himself as the lawful sovereign, and as the same pretension was made by his descendants, a very bitter feeling sprang up between Sweden and Poland,—a feeling which led to many wars during the next sixty years.

Charles IX.

Charles IX. (1600-1611) carried on with splendid vigour the work which had been begun by his father Gustavus Vasa. Under his rule Sweden became a thoroughly Protestant country, and for the first time associated herself to some extent with the general Protestant movement in other lands. Charles watched with especial interest the action of religious parties in Germany, and carefully maintained good relations with the leading German Protestant princes. At home one of his principal aims was to force the aristocracy to be subservient to the crown, and he succeeded as no Swedish king had done before him. For burghers and the peasantry he secured in the diet a more important and more clearly defined place than had formerly belonged to them, and he devised many sagacious measures for the material welfare of his people. He devoted much attention to the development of mining industries, and by the founding of convenient seaports he gave a great impetus to trade. In foreign relations he was not less masterful than in his management of domestic affairs. In 1609 he sent an army into Russia to oppose the false Demetrius, whose pretensions to the Russian throne were supported by Poland. The Swedish generals, after having achieved some success, were obliged to retreat in consequence of a mutiny among their troops, but Charles despatched a fresh force, which did its work so well that the Russians came to terms, and even promised to accept his younger son, Charles Philip, as czar. In the last year of his life Charles was engaged in a war with Christian IV. of Denmark, who invaded Sweden because Charles claimed to be king of the Norwegian Laplanders and sought to exclude the Danes from the extensive trade with Riga. Calmar, notwithstanding the strenuous exertions of Charles, was captured by the Danes, and from this circumstance the struggle came to be known as the Calmar War.

Charles IX. was succeeded by his son Gustavus Adolphus (1611-1632), the most illustrious of the kings of Sweden. He was only seventeen years of age when he became king, but he had already given evidence of high intellectual and moral qualities. One of his first public acts was to appoint as chancellor the youngest of his counsellors, Axel Oxenstjerna, a great statesman whose name is intimately associated with all the most prominent events of his reign. By mingled gentleness and firmness Gustavus won almost immediately the goodwill of his subjects, and before he was many years on the throne he became the object of their most enthusiastic devotion. He showed unfailing respect for the rights of the diet, improved its organization, and summoned it regularly once a year. Industry and trade flourished under his wise rule, and he did much to develop the educational system of Sweden by giving splendid endowments to the university of Upsala and by founding the university of Dorpat and many schools and colleges. He introduced into the army a rigid system of discipline, yet he was adored by his soldiers, who had perfect faith in his military genius and were touched by his care for their welfare and by the cheerfulness with which, when necessary, he shared their hardships.

The war with Denmark which had been begun in his father's time he was obliged to continue, but he did so very unwillingly, and as soon as possible (in 1613) he signed a treaty of peace, by which, in return for the payment of a million thalers, Sweden received back all the territory that had been conquered by the Danes. Having no further cause of anxiety in this direction, he prosecuted with renewed vigour the war with the Russians, who had not kept their promise to recognize Prince Charles Philip as czar. The Swedish general, Count de la Gardie, had gained many advantages in the struggle, and when

Gustavus himself took part in it the Swedes were so successful that in 1617 the czar Michael was glad to conclude the peace of Stolbova, giving up Kexholm, Carolia, and Ingermanland, and confirming Sweden in the possession of Esthonia and Livonia. The next task of Gustavus was to subdue Sigismund of Poland, who had formally renewed his claim to the crown of Sweden after Charles IX's death, and had proved himself one of the most troublesome of the young Swedish king's enemies. In 1621 Gustavus took the field against him, and achieved a series of brilliant successes, which were interrupted only when, in 1629, Austria sent to the aid of Poland a force of 10,000 men under Arnheim.

Meanwhile the Thirty Years' War, begun in 1618, had been raging in Germany. Christian IV of Denmark, who had intervened on behalf of the Protestants, had been forced to lay down his arms, and it seemed in the highest degree probable that the Catholic reaction, headed by the fanatical emperor Ferdinand II, was about to be completely triumphant. Gustavus, like his father and grand father, was an enthusiastic Protestant, and he had watched with grief and dismay the misfortunes of those who were struggling for the right of free judgment in religion. At last he resolved to give them the support they so urgently needed, and, in order that he might without unnecessary delay act upon his decision, he arranged with Poland in 1629 that there should be an armistice for six years. He then began to make preparations for his great enterprise, and in 1630 he embarked for Germany with an army of 15,000 men. In undertaking this splendid task he was not influenced only by religious motives. He wished to punish the Austrians for having helped the Poles, he hoped to find an opportunity of adding to Swedish territory, and there are reasons for supposing that he dreamed of snatching the imperial crown from the Hapsburg dynasty and placing it on his own head. But all the evidence we possess goes to show that these objects were subordinate. His principal aim was to save Protestantism in Germany from extinction.

He had many unexpected difficulties to contend with, for he was distrusted by most of the German Protestant princes. Very soon, however, his tact and courage enabled him to overcome every obstacle, and at Breitenfeld he gained a decisive victory over the imperial general Tilly. After this great success the confidence of the German Protestants revived, and Gustavus was everywhere received as their deliverer. Tilly tried to prevent him from crossing the Lech, but was again defeated, and the Swedish king took possession of Munich, having already held court at Frankfurt. For some time the destinies of the empire appeared to be at his disposal, but all the hopes excited by his heroic career were suddenly cut short by his death in the battle of Lutzen in 1632.

Christina.

Gustavus was succeeded by his daughter Christina, whom, before his departure for Germany, he had presented to the diet as heiress to the crown. During her minority Sweden was governed by five nobles whom the diet appointed to be her guardians, the foremost place being given to Axel Oxenstjerna. They continued the foreign policy of Gustavus, maintaining in Germany a powerful army, which, although no longer uniformly successful, gained many victories over the imperial forces. Christina, carefully educated in accordance with instructions left by her father, became one of the most cultivated women of the 17th century, and at an early age she astonished her guardians by the vigour of her understanding. In 1644, on her eighteenth birthday, she assumed supreme power, and for some time she fulfilled all the expectations which had been formed as to her reign. In 1645 she brought to an end a war with Denmark which had been begun two

years before. The Danes had been repeatedly defeated, and by the treaty of Bromsebro they resigned to Sweden Jemtland and Härjedalen along with the islands of Gotland and Oesel, and gave up Halland for a period of twenty-five years. Contrary to the advice of Oxenstjerna, Christina pressed for the conclusion of peace in Germany, and, when her object was attained, the Swedes had no reason to be dissatisfied with the result. By the peace of Westphalia, concluded in 1648, Sweden obtained the duchies of Bremen, Verden, and Western Pomerania, a part of Eastern Pomerania, and Wismar. Moreover, Sweden was recognized as a state of the empire.

The Swedish people were anxious that Christina should marry, but she declined to sacrifice her independence. In 1649, however, she persuaded the diet to accept as her successor the best of her suitors, her cousin Charles Gustavus of Pfalz-Zweibrücken, the son of the only sister of Gustavus Adolphus. In the following year she was crowned with great pomp. About this time her character seemed to undergo a remarkable change. She became wayward and restless, neglected her tried counsellors, and followed the advice of self-seeking favourites. So much discontent was aroused by her extravagance and fickleness that she at last announced her determination to abdicate, and she abandoned her purpose only in deference to Oxenstjerna's entreaties. She now devoted herself to her duties with renewed ardour, and made her court famous by inviting to it Descartes, Grotius, Salmasius, and other scholars and philosophers. But she had soon to encounter fresh difficulties. During the Thirty Years' War the influence of the nobles had been greatly increased, partly in consequence of their position in the army, partly through the wealth they acquired in Germany. They made as usual so bad a use of their power that an agitation which seemed likely to have most serious consequences sprang up against them among the peasants, the burghers, and the clergy. Unable to bring order out of the prevailing confusion, and longing for repose, Christina finally resolved to resign the crown, and in 1654 she formally laid the royal insignia before the diet in order that they might be transferred to Charles Gustavus, who forthwith became king as Charles X. Christina immediately left the country, and did not return to it for many years. She ultimately made some attempts to recover the crown, as well as to be elected queen of Poland, but her efforts were not successful. She joined the Roman Church, and there was much talk at all the courts in Europe about the eccentricities of her character and about her passionate love of art and learning.

Charles X (1654-1660) devoted his energies chiefly to war, in which he was brilliantly successful. He began his military career by attacking Poland, whose king claimed to be the true heir to the Swedish crown. In a great battle at Warsaw Charles destroyed the Polish army, and Poland would probably soon have been absolutely at his mercy but for the intervention of Russia, which sought to weaken him by invading Esthonia and Livonia. While the war with Poland and Russia was in progress, Charles became involved in a struggle with Denmark, and he conducted it so vigorously and skilfully that the Danes, by the peace of Roeskilde, signed in 1658, gave up Scania, Halland, Blekinge, and various other territories. War with Denmark was several times renewed, and at the time of his death Charles was engaged in making extensive preparations for a fresh onslaught.

He was succeeded by his son Charles XI, a child of Charles four years of age. During the minority of Charles XI the government was carried on by his mother Hedwig Eleonore and by the chancellor De la Gardie and four other ministers. In 1660 they concluded with Poland the

peace of Oliva, whereby Sweden received the whole of Livonia as far as the Düna. Soon afterwards peace was also concluded with Denmark and Russia, the former receiving back Drontheim and Bornholm, which had been taken by Charles X. Sweden, however, kept Scania, Halland, and Blekinge, which were now finally severed from the Danish monarchy. In 1672 Charles XI himself assumed the direction of affairs. For some time he seemed to take little interest in public business, and in 1674 he was rash enough to send an army into Germany to aid Louis XIV in his war with the United Provinces and their allies. The Swedes were defeated at Fehrbellin by the elector of Brandenburg, who at once followed up his victory by taking possession of Pomerania. Christian V of Denmark, thinking he had now a good opportunity of recovering Scania, joined the enemies of France and Sweden, and at sea the Danes gained several great victories over the Swedes. Charles XI, aroused by these disasters, began to show the real vigour of his character. He placed himself at the head of his army, and in several battles so decisively defeated the Danes that they were driven from Scania, the greater part of which they had occupied. When peace was made in 1679, Sweden had to give up to Brandenburg a part of Pomerania, but she sustained no other losses.

At this time the finances of Sweden were in utter confusion, and the revenue was not nearly large enough to cover the necessary expenditure. So many of the crown lands had from time to time been given away to nobles that the administration could not be carried on without a system of crushing taxation. The common people, unable to bear the burdens imposed upon them, had often insisted that these lands should be taken back. Charles XI became convinced that there was no other way out of his difficulties, and in 1680, with the sanction of the diet, he ordered that the fourth part of all the crown lands which had been given away during the previous thirty years should be restored. This, however, was only the beginning of the so-called process of redemption, which was soon extended and carried out with ruthless severity. By this measure some of the foremost families in Sweden were ruined, and the crown was made almost independent of the diet, for it recovered no fewer than ten counties, seventy baronies, and many smaller estates. Charles became virtually an absolute sovereign, and on the whole he made an excellent use of his power. For more than a century Sweden had been almost constantly engaged in war. She now enjoyed a period of repose, and profited greatly by the king's vigorous administration. He built fortresses, reorganized the army and navy, and carried on many important public works in the interests of commerce. He also founded the university of Lund, and made larger provision for popular education, frequently impressing upon the clergy the duty of attending to the intellectual needs of their parishioners. His comparatively early death was lamented by the great majority of the people, who were grateful for the steady determination with which he applied himself to the duties of his office.

Charles
XII.

Charles XII. was succeeded by his son Charles XII. (1697-1718), the most brilliant although not the greatest figure in Swedish history. He was a youth of fifteen when his father died, and he was so enthusiastically devoted to sport and all kinds of physical exercise that he seemed to be utterly destitute of political ambition. Accordingly Augustus II of Poland and Saxony, Peter I. of Russia, and Frederick IV of Denmark, thinking the time had come for the recovery of the possessions taken from their predecessors by Sweden, formed an alliance against him, and they appear to have had no doubt that he would be easily overcome. Charles XII., however, was

in reality a man of extraordinary vigour and daring, and he soon convinced his enemies that they would find in him a formidable opponent. In 1700 he began what is known as the Northern War by suddenly advancing against Copenhagen, which he was about to besiege when Frederick, alarmed by the overwhelming numbers of the enemy, accepted Charles's terms, and signed the peace of Travendahl. Charles at once crossed the Baltic to attack Augustus II and Peter I., the former of whom was besieging Riga, while the latter threatened Narva. At Narva the Swedish king gained a splendid victory, and afterwards he defeated the Saxons, driving them away from Riga. If he had now concluded peace, he might have been for many years by far the greatest potentate in northern Europe. But he was resolved to humiliate Augustus II, and this he did most effectually. Defeated at Klissoff, Augustus was held to have forfeited the throne of Poland, and at Charles's suggestion Stanislaus Lecinski was elected king. Charles followed Augustus into Saxony, and in 1706 forced him to conclude the treaty of Altranstädt. Meanwhile Peter I. had been taking possession of Swedish territory on the Baltic, and on a portion of it had begun to build St Petersburg. Instead of attacking him directly, Charles resolved to thwart him by seizing Moscow, and this decision proved fatal to his great designs. Worn out by a long and dreary march, during which many soldiers died of hunger and disease, his dispirited army was defeated at Poltava (1709), and Charles, ignorant of the real condition of the enemy's forces, fled across the Russian frontier into Turkey. He remained five years in the Turkish dominions, trying to induce the sultan to become his ally. But, although war did break out between Russia and Turkey, the Turks had little confidence in Charles, for it was supposed that he wished to become king of Poland, and the sultan suspected that if this scheme were effected he might become a dangerous enemy of the Ottoman empire. Convinced at last that nothing was to be gained from Turkey, Charles made his escape, and in fourteen days rode from Adrianople to Stralsund. In his absence the war had been continued by Peter I., who had soon been joined again by Augustus II and Frederick IV, and ultimately the alliance was strengthened by the accession of the king of Prussia and the elector of Hanover, each of whom was eager to possess those Swedish territories which were in the neighbourhood of his own dominions. In Stralsund, which was besieged by an army of Danes, Saxons, Prussians, and Russians, Charles displayed astonishing valour and military skill, but about a year after his arrival the town was obliged to surrender. He then went to Lund, adopted vigorous measures for the defence of the Swedish coasts, and attacked Norway. By the advice of his friend Baron Görtz he entered into negotiations with Peter I., who was not unwilling to come to terms. Had Charles lived, it is possible that the tide of misfortune might have turned, but he was shot dead while engaged in besieging Frederikshall. His intention was to conquer Norway after having made peace with Russia, and from Norway to cross to Great Britain, where he hoped to punish the elector of Hanover by placing the Pretender on the English throne.

All the conditions of political life in Sweden were now changed. The Swedish people were surrounded by a crowd of enemies whom they could not hope to overcome, and in the confusion caused by the Northern War the nobles had recovered their ancient power. As Charles XII. had no children, it was doubtful whether the crown should pass to his younger sister Ulrica Eleonore or to Charles Frederick of Holstein Gottorp, the son of his elder sister Hedvig Sophia. The nobles decided in favour of

Ulrica Eleonore
Frederick I
Ulrica Eleonore, who secured their support by undertaking to place all real power in their hands. In 1720 her authority was transferred to her husband, Prince Frederick of Hesse, who reigned as Frederick I until his death in 1751. He reigned, however, only in name, for the diet, which now practically meant the nobles, usurped every important prerogative of the crown. There were two parties, known as the Hats and the Caps, who assailed one another with much vehemence, but on one point they were agreed, and that was that the Swedish people should in future be ruled, not by a king, or by a king acting in conjunction with the diet, but by the aristocracy.

Meanwhile Sweden had been shorn of most of the foreign territory for which in past times she had made so many sacrifices. In 1719 she had given up Bremen and Verden to Hanover, in 1720 Stettin and Western Pomerania as far as the Peco were resigned to Prussia, and in 1721 Russia obtained Livonia, Esthonia, Ingermanland, and a part of Viborg län. In 1741, against the wish of King Frederick, the Hats plunged into a war with Russia, and the consequence was that in 1743 Sweden had to conclude the degrading peace of Åbo, by which she lost Eastern Finland. She had even to beg Russia to aid her against Denmark, and she was obliged to recognize Adolphus Frederick of Holstein-Gottorp, a relative of the czarina Elizabeth, as heir to the throne.

From the reign of Charles IX until that of Charles XII, Sweden had been one of the greatest powers in Europe. She had conducted many wars successfully, she had secured a vast territory beyond her proper limits, in the crisis of the struggle between Catholicism and Protestantism she had lent powerful support to those who were fighting for spiritual freedom. In the management of international relations during this period no great decision was arrived at by any European state without reference to her wishes, and there seemed to be solid reasons for the belief that her power would be enduring. Yet she suddenly sank from her high position to that of a third rate state, which exercised little or no influence on the affairs of the rest of the world. This striking change was immediately due to the calamities brought upon his country by Charles XII, but sooner or later it would have come even if he had never lived. The circumstances of Europe were in his time very different from those with which Gustavus Adolphus had to deal. Russia had emerged as a united and growing state, Prussia had begun to display some of the qualities which were ultimately to make her supreme in Germany, and Hanover had been made important by the accession of the house of Brunswick to the throne of Great Britain. Sweden could not have permanently maintained her conquests against these new political forces. Charles XII, by his bold but headstrong policy, only hastened a process which was in any case inevitable.

Adolphus Frederick
Under Adolphus Frederick (1751-1771) Sweden took part in the Seven Years' War, siding with the enemies of Frederick the Great. But she was now so feeble, and her statesmen were so incompetent, that her intervention led to no serious results. The Hats, who were responsible for the humiliation brought upon Sweden by this exhibition of her weakness, had to make way for the Caps, but neither party had the power or the will to arouse the

Gustavus III
nation from the lethargy into which it had fallen. Gustavus III, Adolphus Frederick's son (1771-1792), was a man of a very different temper from his indolent father. He had great energy of character, a thorough comprehension of some of the conditions of political progress, and a frank and persuasive manner. In early youth he seems to have convinced himself that it would be impossible for Sweden to become a prosperous country unless the royal

authority were restored, and when at the age of twenty-five he succeeded his father he secretly resolved to make the crown supreme.

He carried out his plans with remarkable ability and caution. Under the pretence that he wished to introduce a new system of military manœuvres, he collected around him about two hundred officers, most of whom were young men, and they were gradually induced to pledge themselves to support him. Agents were despatched to win over the regiments in the provinces, and Gustavus was careful to make a good impression on the bourgeois class and on the peasantry. When all was ready, the commandant of Christianstad, on the 12th of August 1772, as previously arranged, formally renounced his allegiance to the diet, and one of the king's brothers went to the town with the regiments in the neighbourhood and pretended to besiege it. Suspicions were aroused at Stockholm, and at a meeting of the council of state Gustavus was bitterly reproached by some of the members. He then boldly proclaimed his purpose. The members of the council of state were arrested, and the king received the homage of the leading authorities in the military, naval, and civil services. The diet was forthwith summoned, and at its first sitting Gustavus spoke of the lamentable condition of the kingdom, and of the need for more efficient methods of government. He had no wish, he said, to establish an absolute monarchy, but it was necessary that the supremacy of the aristocracy should be destroyed, and that the country should re-establish the system which existed in the time of Gustavus Adolphus, when the crown and the diet had each its separate functions and worked cordially together. A new constitution, which had been drawn up, placing executive power wholly in the king's hands, was afterwards read, and at once accepted.

Delivered from the trammels which had hampered his immediate predecessors, Gustavus worked hard for the welfare of his subjects. Agriculture, industry, and trade revived, the army and navy were improved, and the educated classes began to show greater interest in art, literature, and science. Unfortunately the king took the court of France as the model for his own court, and the country resented the incessant demands for money which were rendered necessary by his personal extravagance. In 1788 he declared war with Russia, hoping to recover Livonia and the part of Finland which Russia had conquered, and the discontent he had aroused found expression in the army, the leaders of which declined to fight, protesting that the war ought not to have been begun without the sanction of the diet. At the same time Denmark was persuaded by the czarina Catherine to attack Sweden. Gustavus seemed to be on the verge of ruin, but he was saved by his own courage and sagacity. Hastening back from Finland, he was able to rescue Gothenburg from the Danes with a force raised in Dalecarlia, and soon afterwards, through the intervention of England and Prussia, Denmark was induced to withdraw from the struggle. The majority of the diet, seeing the dangers to which the nation was exposed, rallied around the king, and, notwithstanding the opposition of the nobles, recognized the right of the crown to declare war. Impressed by the firm and rapid action of Gustavus, the army returned to its allegiance, and the conflict with Russia was begun in earnest. In 1789 the Swedes were very unsuccessful, but in the following year they gained several victories both at sea and on land. Gustavus saw, however, that it would be impossible for him to wrest from Russia any of her territories, and in 1790 peace was concluded on the understanding that both states should occupy the position they held before the war.

Gustavus was greatly excited by the French Revolution, and sought to form an alliance with Russia, Prussia, and Austria for the restoration of Louis XVI. But the diet refused to support his wild schemes. Several nobles, desiring to avenge the supposed wrongs of their order, entered into a conspiracy against him, and in 1792 he was mortally wounded by an assassin who acted as their agent.

Gustavus
IV

Gustavus IV (1792-1809) was not quite fourteen years old when his father was murdered, and during his minority the government was carried on by his uncle the duke of Södermanland. Gustavus began to exercise royal authority in 1796. His reign was remarkable chiefly for the obstinacy with which he clung to his own ideas, no matter how far they might conflict with the obvious interests of his country. He had a bitter detestation of Bonaparte, and in 1803 went to Carlsruhe in the hope that he might induce the emperor and some of the German princes to act with him in support of the Bourbons. His enmity led to an open rupture with France, and even after the peace of Tilsit, when Russia and Prussia offered to mediate between him and the French emperor, he refused to come to terms. The consequence was that he lost Stralsund and the island of Rugen. He displayed so much friendship for England that Russia and Denmark, acting under the influence of France, declared war against him, and the whole of Finland was soon held by Russian troops. Gustavus attacked Norway, but his army was driven back by the Danes and Norwegians. He still declined to make peace, and he even alienated England when she attempted to influence him by moderate counsels. The Swedish people were so enraged by the consequences of his policy that in 1809 he was dethroned, and the claims of his descendants to the crown were also repudiated. He was succeeded by the duke of Södermanland, who reigned as Charles XIII.

Charles
XIII

Charles XIII (1809-1818) concluded peace with Russia, Denmark, and France, ceding to Russia by the treaty of Frederikshamm (1809) the whole of Finland. The loss of this territory, which had been so long associated with the Swedish monarchy, was bitterly deplored by the Swedes, but it was universally admitted that under the circumstances the sacrifice was unavoidable. Charles assented to important changes in the constitution, which were intended to bring to an end the struggle between the crown and the aristocracy and to provide some security for the maintenance of popular rights. The king was still to be at the head of the executive, but it was arranged that legislative functions and control over taxation should belong to the diet, which was to consist of four orders—nobles, clergymen, burghers, and peasants.

As Charles XIII was childless, the diet elected as his successor Prince Christian Augustus of Holstein Sonderburg Augustenburg. In 1810, soon after his arrival in Stockholm, this prince suddenly died, and Sweden astonished Europe by asking Marshal Bernadotte to become heir to the throne. Bernadotte, who took the name of Charles John, was a man of great vigour and resource, and soon made himself the real ruler of Sweden. Napoleon treated Sweden as almost a conquered country, and compelled her to declare war with England. Bernadotte, associating himself heartily with his adopted land, resolved to secure its independence, and entered into an alliance with Russia. In 1813 he started with an army of 20,000 Swedes to co-operate with the powers which were striving finally to crush the French emperor. The proceedings of the Swedish crown prince were watched with some suspicion by the allies, as he was evidently unwilling to strike a decisive blow at France, but after the battle of Leipsic he displayed much activity. He blockaded Hamburg, and by the peace of Kiel, concluded in January 1814, he

forced Denmark to give up Norway. He then entered France, but soon returned, and devoted his energies to the conquest of Norway, which was very unwilling to be united with Sweden. Between the months of July and November 1814 the country was completely subdued, and Charles XIII was proclaimed king. The union of Sweden and Norway, which has ever since been maintained, was recognized by the congress of Vienna, and it was placed on a sound basis by the frank adoption of the principle that, while the two countries should be subject to the same crown and act together in matters of common interest, each should have complete control over its internal affairs. The new relation of their country to Norway gave much satisfaction to the Swedes, whom it consoled in some measure for the loss of Finland. It also made it easy for them to transfer to Prussia in 1815 what remained of their Pomeranian territories.

In 1818 Bernadotte mounted the throne as Charles XIV, and he reigned until he died in 1844. Great material improvements were effected during his reign. He caused new roads and canals to be constructed, he encouraged the cultivation of districts which had formerly been barren, and he founded good industrial and naval schools. He was not, however, much liked by his subjects. He never mastered the Swedish language, and he was so jealous of any interference with his authority that he sternly punished the expression of opinions which he disliked. To the majority of educated Swedes the constitution seemed to be ill adapted to the wants of the nation, and there was a general demand for a political system which should make the Government more directly responsible to the people. In 1840 a scheme of reform was submitted to the diet by a committee which had been appointed for the purpose, but the negotiations and discussions to which it gave rise led to no definite result.

Charles XIV was succeeded by his son Oscar I. (1844-1859). Oscar had always expressed sympathy with liberal opinions, and it was anticipated that the constitutional question would be settled during his reign without much difficulty. These expectations were disappointed. The diet met soon after his accession, and was asked to accept the scheme which had been drawn up in 1840. The measure received the cordial approval of the burghers and peasants, but was rejected by the nobles and the clergy. In 1846 a committee was appointed to prepare a new set of proposals, and late in the following year the discussion of its plans began. While the debates on the subject were proceeding some excitement was produced by the revolutionary movement of 1848, and a new ministry, pledged to the cause of reform, came into office. The scheme devised by this ministry was accepted by the committee to which it was referred, but the provisions of the existing constitution rendered it necessary that the final settlement should depend upon the vote of the next diet. When the diet met in 1850 it was found that the difficulties in the way were for the time insuperable. The proposals of the Government were approved by a majority of the burghers, but they were opposed by the nobles, the clergy, and the peasantry. The solution of the problem had, therefore, to be indefinitely postponed.

Although the constitution was not reformed, much was done in other ways during the reign of Oscar I. to promote the national welfare. The criminal law was brought into accordance with modern ideas, and the law of inheritance was made the same for both sexes and for all classes of the community. Increased freedom was secured for industry and trade, the methods of administration were improved, and the state took great pains to provide the country with an efficient railway system. The result of the wise legislation of this period was that a new spirit of

enterprise was displayed by the commercial classes, and that in material prosperity the people made sure and rapid progress

In 1848, when the difficulty about Schleswig-Holstein led to war between Denmark and Germany, the Swedes sympathized cordially with the Danes, of whom they had for a long time ceased to be in the slightest degree jealous. Swedish troops were landed in Funen, and through the influence of the Swedish Government an armistice was concluded at Malmö. The excitement in favour of Denmark soon died out, and when the war was resumed in 1849 Sweden resolutely declined to take part in it. The outbreak of the Crimean War greatly alarmed the Swedes, who feared that they might in some way be dragged into the conflict. In 1855, having some reason to complain of Russian acts of aggression on his northern frontiers, the king of Sweden and Norway concluded a treaty with England and France, pledging himself not to cede territory to Russia, and receiving from the Western powers a promise of help in the event of his being attacked. The demands based on this treaty were readily granted by Russia in the peace of Paris in 1856.

Charles
XV

Charles XV (1859-1872) mounted the throne after his father's death. Nearly two years before his accession he had been made regent in consequence of Oscar I's ill health. Charles was a man of considerable intellectual ability and of decidedly popular sympathies, and during his reign the Swedish people became enthusiastically loyal to his dynasty. In 1860 two estates of the realm—the peasants and the burghers—presented petitions, begging him to submit to the diet a scheme for the reform of the constitution. This request he willingly granted. The main provisions of the plan offered in his name were that the diet should consist of two chambers,—the first chamber to be elected for a term of nine years by the provincial assemblies and by the municipal corporations of towns not represented in those assemblies, the second chamber to be elected for a term of three years by all natives of Sweden possessing a specified property qualification. The executive power was to belong to the king, who was to act under the advice of a council of state responsible to the national representatives. This plan, which was received with general satisfaction, was finally adopted by the diet in 1866, and is still in force.

Early in the reign of Charles XV there were serious disputes between Sweden and Norway, and the union of the two countries could scarcely have been maintained but for the tact and good sense of the king. He also exercised a steady influence in 1863, when his people expressed passionate sympathy with the Poles in their insurrection against Russia, and with the Danes in their war with Prussia and Austria.

Oscar II

Charles XV died in 1872, and was succeeded by his brother Oscar II, who still reigns (1887). Under him Sweden has maintained good relations with all foreign powers, and political disputes in the diet have never been serious enough to interrupt the material progress of the nation.

Many documents relating to Swedish history have been published in *Scriptores Rerum Suecicarum Medii Ævi*, edited by Fant, Geijer, and Schroder, in *Scriptores Suecici Medii Ævi*, edited by Rietz, and in other collections. Among the older histories of Sweden may be named those by Dalin and Lagerbring in the 18th century and by Ruhs in the 19th. More important works on the subject are those by Geijer, Carlson, Fryxell, and Strinnholm. (J SI)

PART III — LITERATURE.

Swedish literature, as distinguished from compositions in the common *norrena tunga* of old Scandinavia, cannot be said to exist earlier than the 13th century. Nor until the period of the Reformation was its development in

any degree rapid or copious. The oldest form in which Swedish¹ exists as a written language is the series of manuscripts known as *Landskapslagarne*, or "The Common Laws." These are supposed to be the relics of a still earlier age, and it is hardly believed that we even possess the first that was put down in writing. The most important and the most ancient of these codes is the "Elder West Gota Law," reduced to its present form by the law man Eskil about 1230. Another of great interest is Magnus Eriksson's "General Common Law," which was written in 1347. These ancient codes have been collected and edited by Prof. Schlyter. The chief ornament of mediæval Swedish literature is *Um Styrlise Kununga ok Hofdunga* ("On the Conduct of Kings and Princes"), first printed, by command of Gustavus II. Adolphus, in 1634. The writer is not known, it has been conjecturally dated 1325. It is a handbook of moral and political teaching, expressed in terse and vigorous language. St. Bridget, or Birgitta (1302?-1373), an historical figure of extraordinary interest, has left her name attached to several important religious works, in particular to a collection of *Uppenbarelser* ("Revelations"), in which her visions and ecstatic meditations are recorded, and a version, the first into Swedish, of the five books of Moses. This latter was undertaken, at her desire, by her father confessor Matthias (d. 1350), a priest at Linköping. The translation of the Bible was continued a century later by a monk named Johannes Budde (d. 1484).

In verse the earliest Swedish productions were probably the folk-songs. The age of these, however, has been commonly exaggerated. It is doubtful whether any still exist which are as old, in their present form, as the 13th century. The bulk are now attributed to the 15th, and many are doubtless much later still. The last, such as "Åxel och Valborg," "Liten Karin," "Kampen Grimborg," and "Häbor och Signild," deal with the adventures of romantic mediæval romance. Almost the only positive clue we hold to the date of these poems is the fact that one of the most characteristic of them, "Engelbrekt," was written by Tomas, bishop of Strängnäs, who died in 1443. Tomas, who left other poetical pieces, is usually called the first Swedish poet. There are three rhyming chronicles in mediæval Swedish, all anonymous. The earliest, *Erikskrönikan*, is attributed to 1320, *Karlskrönikan* is at least 120 years later, and the third, *Stenkrönikorna*, was probably written about 1500. All three have been edited by G. E. Klemming. The collection of rhymed romances which bears the name of *Queen Euphemia's Songs* must have been written before the death of that lady in 1312. They are believed to date from 1303. They are versions of three mediæval stories taken from French and German sources, and they deal respectively with King Arthur and the Table Round, with Duke Frederick of Normandy, and with Flores and Blancheflor. They possess very slight poetic merit in their Swedish form. A little later the romance of *King Alexander* was translated by, or at the command of, Bo Jonsson Grip, this is more meritorious. A brilliant and pathetic relic of the close of the mediæval period exists in the *Love Letters* addressed in 1498 by Ingrid Persdotter, a nun of Vadstena, to the young knight Åxel Nilsson. The first book printed in the Swedish language appeared in 1495.

The 16th century added but little to Swedish literature, and that little is mostly connected with the newly founded university of Upsala. The Renaissance scarcely made itself felt in Scandinavia, and even the Reformation failed to waken the genius of the country. Psalms and didactic

¹ For the Swedish language, see SCANDINAVIAN LANGUAGES, vol. xxi. pp. 370-372.

spiritual poems were the main products of Swedish letters in the 16th century. Two writers, the brothers Petri, take an easy prominence in so barren a period. Olans Petri (1497-1552) and Laurentius Petri (1499-1573) were Carmelite monks who proceeded in 1516 to Wittenberg to study theology under Luther, and who came back to Sweden as the apostles of the new faith. Olaus, who is one of the noblest figures in Swedish annals, was of the executive rather than the meditative class. He found time, however, to write a *Chronicle*, which is the earliest prose history of Sweden, a mystery play, *Tobie Comedia*, which is the first Swedish drama, and three psalm books, the best known being published in 1530 under the title of *Någre Gudhelige Vysor* ("Certain Divine Songs"). Laurentius Petri, who was archbishop of all Sweden, edited or superintended the translation of the Bible published at Upsala in 1540. He also wrote many psalms. Laurentius Andreae, who died in 1552, had previously prepared a translation of the New Testament, which appeared in 1526. He was a polemical writer of prominence on the side of the Reformers. Finally, Petrus Niger (Peder Svart), bishop of Vesterås (d. 1562), wrote a chronicle of the life of Gustavus I up to 1533, in excellent prose. The same writer left unpublished a history of the bishops of Vesterås his predecessors. The latter half of the 16th century is a blank in Swedish literature.

With the accession of Charles IX. and the consequent development of Swedish greatness, literature began to assert itself in more vigorous forms. The long life of the royal librarian, Johannes Buræus (1568-1652), formed a link between the age of the Petri and that of Stjernhjelm. Buræus studied all the sciences then known to mankind, and confounded them all in a sort of Rabbinical cultus of his own invention, a universal philosophy in a multitude of unreadable volumes. But he was a patient antiquarian, and advanced the knowledge of ancient Scandinavian mythology and language very considerably. He awakened curiosity and roused a public sympathy with letters, nor was it without significance that two of the greatest Swedes of the century, Gustavus Adolphus and the poet Stjernhjelm, were his pupils. The reign of Charles IX. saw the rise of secular drama in Sweden. The first comedy was the *Tisbe* of Magnus Olai Astero-phorus (d. 1647), a coarse but witty piece on the story of Pyramus and Thisbe, acted by the schoolboys of the college of Arboga in 1610. This play is the *Ralph Roister Doister* of Swedish literature. A greater dramatist was Johannes Messenius (1579-1636), who, having been discovered plotting against the Government during the absence of Gustavus in Russia, was condemned to imprisonment for life—that is, for twenty years. Before this disaster he had been professor in Upsala, where his first historical comedy *Disa* was performed in 1611 and the tragedy of *Signill* in 1612. The design of Messenius was to write the history of his country in fifty plays, he completed and produced six. These dramas are not particularly well arranged, but they form a little body of theatrical literature of singular interest and value. Messenius was a genuine poet, the lyrics he introduces have something of the charm of the old ballads. He wrote abundantly in prison, his *magnum opus* was a history of Sweden in Latin, but he has also left, in Swedish, two important rhyme-chronicles. Messenius was imitated by a little crowd of playwrights. Nikolaus Catonius (d. 1655) wrote a fine tragedy on the Trojan War, *Trojenborg*, in which he excelled Messenius as a dramatist. Andreas Prytz, who died in 1655 as bishop of Linköping, produced several religious chronicle plays from Swedish history. Jacobus Rondeletius (d. 1662) wrote a curious "Christian tragi-comedy" of *Judas Redivivus*. These

plays were all acted by schoolboys and university youths, and when they went out of fashion among these classes the drama in Sweden almost entirely ceased to exist. Two historians of the reign of Charles IX., Erik Goransson Tegel (d. 1636) and Ægidius Girs (d. 1639), deserve mention.

The reign of Gustavus Adolphus was adorned by one Stjernhjelm great writer, the most considerable in all the early history of Sweden. The title of "the Father of Swedish Poetry" has been universally awarded to Goran Lilla, better known by his adopted name of Georg Stjernhjelm (1598-1672). This extraordinary man was born at Wika in Dalecarlia on the 7th of August 1598. He took his degree at Greifswald, and spent some years in travelling over every quarter of Europe. On his return he attracted the notice of Gustavus Adolphus, who gave him a responsible post at Dorpat in 1630, and raised him next year to the nobility. After the king's death Christina attached him, as a kind of poet-laureate, to her court in Stockholm. His property lay in Livonia, and when the Russians plundered that province in 1656 the poet was reduced to extreme poverty for two or three years. He died at Brunkeborg in Stockholm on the 22d of April 1672. Stjernhjelm was a man of almost universal attainment, but it is mainly in verse that he has left his stamp upon the literature of his country. He found the language rough and halting, and he moulded it into perfect smoothness and elasticity. His master Buræus had written a few Swedish hexameters by way of experiment. Stjernhjelm took the form and made it national. His greatest poem, *Hercules*, is a didactic allegory in hexameters, written in very musical verse, and with an almost Oriental splendour of phrase and imagery. In its faults as well as its beauties the style of Stjernhjelm reminds us of that of his great Dutch contemporary Vondel. He was certainly influenced by a writer a few months older than himself, the German poet Martin Opitz. The *Hercules*, which deals with the familiar story of the dispute for the hero between Duty and Pleasure, was first printed, at Upsala, in 1653, but was finished some years earlier. *Brollops-Besvars Ihuglommelse*, a sort of serio-comic epithalamium in the same measure, is another very brilliant work of Stjernhjelm. His masques, *Then fågne Cupido* ("Cupid Caught") (1649), *Freds-aft* ("The Birth of Peace") (1649), and *Parnassus Triumphans* (1651), were written for the entertainment of the queen, and have a charming lyrical lightness. He can scarcely, however, be said to have been successful in his attempt, in the first two of these, to introduce unrhymed song measures. Stjernhjelm was an active philologist, and left a great number of works on language, of which only a few have ever been printed. He wrote letter A of the earliest Swedish dictionary, published in 1643, and a work on mathematics entitled *Archimedes Reformatus*. No brighter intellectual figure arose in Sweden till the beginning of the 19th century.

The claim of Stjernhjelm to be the first Swedish poet Rosen may be contested by a younger man, but a slightly earlier one. writer, Gustaf Rosenhane (1619-1684), who was a reformer on quite other lines. If Stjernhjelm studied Opitz, Rosenhane took the French poets of the Renaissance for his models, and in 1650 wrote a cycle of one hundred sonnets, the earliest in the language, these were published under the title *Venerd* in 1680. Rosenhane printed in 1658 a "Complaint of the Swedish Language" in thirteen hundred rattling rhyming lines, and in 1682 a collection of eighty songs. He was a metrist of the artistic order, skilful, learned, and unimpassioned. His zeal for the improvement of the literature of his country was beyond question. Most of the young poets followed Stjernhjelm rather than Rosen-

bane As personal friends and pupils of the former, the brothers Columbus deserve special attention. Each wrote copiously in verse, but Johan (1640–1684) almost entirely in Latin, while Samuel (1642–1678), especially in his *Od'r Suetlicæ*, showed himself an apt and fervid imitator of the Swedish hexameters of Stjernhjelm. Of a rhyming family of Hjarne, it is enough to mention one member, Urban Hjarne (1641–1724), who introduced the new form of classical tragedy from France, in a species of transition from the masques of Stjernhjelm to the later regular rhymed dramas. His best play was a *Rosmunda*. Lars Johansson (1642–1674), who called himself "Lucidor the Unfortunate," has been the subject of a whole tissue of romance, most of which is fabulous. It is true, however, that he was stabbed, like Marlowe, in a midnight brawl at a tavern. His poems were posthumously collected as *Flowers of Helicon, Plucked and Distributed on various occasions by Lucidor the Unfortunate*. Stripped of the myth which had attracted so much attention to his name, Lucidor proves to be an occasional rhymster of a very low order. Haquin Spegel (1645–1714), the famous archbishop of Upsala, wrote a long didactic epic in alexandrines, *God's Labour and Rest*, with an introductory ode to the Deity in rhymed hexameters. He was also a good writer of hymns. Another ecclesiastic, the bishop of Skara, Jesper Svedberg (1653–1735), wrote sacred verses, but is better remembered as the father of Swedenborg. Peter Lagerlof (d. 1699) cultivated a pastoral vein in his *Elisandra* and *Lucilla*, he was professor of poetry, that is to say, of the art of writing Latin verses, at Upsala. Olof Wexionius (1656–1690?) published his *Sinne-djvel*, a collection of graceful miscellaneous pieces, in 1684, in an edition of only 100 copies. Its existence was presently forgotten, and the name of Wexionius had dropped out of the history of literature, when Hansell recovered a copy and reprinted its contents in 1863. We have hitherto considered only the followers of Stjernhjelm, we have now to speak of an important writer who followed in the footsteps of Rosenhane. Gunno Eurelius, afterwards ennobled with the name of Dahlstjerna (1661–1709), early showed an interest in the poetry of Italy. In 1690 he translated Guarini's *Pastor Fido*, and in or just after 1697 published, in a folio volume without a date, his *Kunga-Skald*, the first original poem in *ottava rima* produced in Swedish. This is a bombastic and vainglorious epic in honour of Charles XI, whom Eurelius adored, it is not, however, without great merits, richness of language, flowing metre, and the breadth of a genuine poetic enthusiasm. He published a little collection of lamentable sonnets when his great master died. Eurelius struck the lyre several times in honour of Charles XII, but these poems have all perished. He was a true patriot, and grief at the defeat of Poltava is said to have cost him his life. Johan Runins (1679–1713), called the "Prince of Poets," published a collection entitled *Dudam*, in which there is nothing to praise, and with him the generation of the 17th century closes. Talent had been shown by certain individuals, but no healthy school of Swedish poetry had been founded, and the latest imitators of Stjernhjelm had lost every vestige of taste and independence.

In prose the 17th century produced but little of importance in Sweden. Gustavus Adolphus (1594–1632) was the most polished writer of its earlier half, and his speeches take an important place in the development of the language. The most original mind of the next age was Olof Rudbeck (1630–1702), the famous author of *Atlant er Manhem*. He spent nearly all his life in Upsala, building anatomical laboratories, conducting musical concerts, laying out botanical gardens, arranging medical lecture rooms—in a word, expending ceaseless

energy on the practical improvement of the university. He was a genius in all the known branches of learning, at twenty-three his physiological discoveries had made him famous throughout Europe. His *Atlant* (or *Atlantila*) appeared in four folio volumes, in Latin and Swedish, in 1679–98, it was an attempt to summon all the authority of the past, all the sages of Greece and the bards of Iceland, to prove the inherent and indisputable greatness of the Swedish nation, in which the fabulous Atlantis had been at last discovered. It was the literary expression of the majesty of Charles XI, and of his autocratical dreams for the destiny of Sweden. From another point of view it is a monstrous hoard or cairn of rough-hewn antiquarian learning, now often praised, sometimes quoted from, and never read. Olof Verelius (1618–1682) had led the way for Rudbeck, by his translations of Icelandic sagas, a work which was carried on with greater intelligence by Johan Peringskjöld (1654–1720), the editor of the *Heimskringla*. The French philosopher Descartes, who died at Christina's court at Stockholm in 1650, found his chief, though posthumous, disciple in Anders Rydelius (1671–1738), bishop of Lund, who was the master of Dalin, and thus connects us with the next epoch. Charles XII, under whose special patronage Rydelius wrote, was himself a metaphysician and physiologist of merit.

A much more brilliant period followed the death of Charles XII. The influence of France and England took the place of that of Germany and Italy. The taste of Louis XIV, tempered by the study of Addison and Pope, gave its tone to the academical court of Queen Ulrica Eleonore, and Sweden became completely a slave to the periwigs of literature, to the unities and graces of classical France. Nevertheless this was a period of great intellectual stimulus and activity, and Swedish literature took a solid shape for the first time. This Augustan period in Sweden closed somewhat abruptly about 1765. Two writers in verse connect it with the school of the preceding century. Jacob Frese (1691–1729), whose poems were published in 1726, was an elegiacal writer of much grace, who foreshadowed the idyllic manner of Creutz. Samuel von Truëwald (1688–1743) played a very imperfect Dryden to Dalin's Pope. He was the first Swedish satirist, and introduced Boileau to his countrymen. His *Satire upon our Stupid Poets* may still be read with entertainment. Both in verse and prose Olof von Dalin (1708–1763) takes a higher place than any writer since Stjernhjelm. He was inspired by the study of his great English contemporaries. His *Swedish Argus* (1733–34) was modelled on Addison's *Spectator*, his *Thoughts about Critics* (1736) on Pope's *Essay on Criticism*, his *Tale of a Horse* on Swift's *Tale of a Tub*. Dalin's style, whether in prose or verse, was of a finished elegance. His great epic, *Swedish Freedom* (1742), was written in alexandrines of far greater smoothness and vigour than had previously been attempted. When in 1737 the new Royal Swedish theatre was opened, Dalin led the way to a new school of dramatists with his *Brynhilda*, a regular tragedy in the style of Crébillon père. In his comedy of *The Envious Man*, he introduced the manner of Molière, or more properly that of Holberg. His songs, his satires, his occasional pieces, without displaying any real originality, show Dalin's tact and skill as a workman with the pen. He stole from England and France, but with the plagiarism of a man of genius, and his multifarious labours raised Sweden to a level with the other literary countries of Europe. They formed a basis upon which more national and more scrupulous writers could build their various structures. A foreign critic, especially an English one, will never be able to give Dalin so much credit as the

Dahl-
stjerna

Rudbeck.

Swedes do, but he was certainly an unsurpassable master of *pastiche*

Fru
Norden-
flycht.

The only poet of importance who contested the laurels of Dalin was a woman. Hedvig Charlotta Nordenflycht (1718-1763) was the centre of a society which ventured to rival that which Queen Ulrica Eleonore created and Dalin adorned. Both groups were classical in taste, both worshipped the new lights in England and France. Fru Nordenflycht wrote with facility and grace, her collection of lyrics, *The Sorrowing Turtle-dove* (1743), in spite of its affectation, enjoyed and merited a great success, it was the expression of a deep and genuine sorrow—the death of her husband after a very brief and happy married life. It was in 1744 that she settled in Stockholm and opened her famous literary salon. She was called “The Swedish Sappho,” and scandal has been needlessly busy in giving point to the allusion. It was to Fru Nordenflycht's credit that she discovered and encouraged the talent of two very distinguished poets younger than herself, Creutz and Gyllenberg. Gustaf Filip Creutz (1729-1785) was a Finlander who achieved an extraordinary success with his idyllic poems, and in particular with the beautiful pastoral of *Atis och Camilla*, long the most popular of all Swedish poems. In 1763, the year of the death of Dalin and of Fru Nordenflycht, Creutz ceased to write, having been appointed minister to Spain, he gave up poetry for politics. Gustaf Frederik Gyllenberg (1731-1808) was a less accomplished poet, less delicate and touching, more rhetorical and artificial. His epic *Tåget öfver Balt* (“The Expedition across the Belt”) (1785) is an imitation, in twelve books, of Voltaire's *Henriade*, and deals with the prowess of Charles X. It is impossible to read it. He wrote fables, allegories, and satires. He outlived his chief contemporaries so long that the new generation addressed him as “Father Gyllenberg.” Anders Odel (1718-1773) wrote in 1739 the famous “Song of Malcolm Sinclair,” the *Sinclairssåsa*. The writers of verse in this period were exceedingly numerous, but it cannot be needful, in a sketch of this kind, to preserve the minor names.

Creutz.

Gyllen-
borg

In prose, as was to be expected, the first half of the 18th century was rich in Sweden as elsewhere. The first Swedish novelist was Jakob Henrik Mork (1714-1763). His romances have some likeness to those of Richardson, they are moral, long winded, and slow in evolution, but written in an exquisite style, and with much knowledge of human nature. *Adalrik och Götthilda*, which went on appearing from 1742 to 1745, is the best known, it was followed, between 1749 and 1758, by *Thecla*. Jakob Wallenberg (1746-1778) described a voyage he took to the East Indies and China under the very odd title of *Min Son på Galejan* (“My Son at the Galleys”), a work full of humour and originality. We have already indicated that Dalin's activity in prose was scarcely less abundant or less meritorious than that in verse. He wrote an important history of Sweden down to Charles IX. His contemporary Johan Ihre (1707-1780), a professor at Upsala, edited the *Codex Argenteus* of Ulfilas, and produced the first complete Swedish dictionary. In doing this he was assisted by the labours of two other grammarians, Sven Hof (d. 1786) and Abraham Sahlstedt (d. 1776). Karl Gustaf Tessin (1695-1770) wrote on politics and on æsthetics. Anders Johan von Höpken (1712-1789), the friend of Ulrica Eleonore, was a master of rhetorical compliment in addresses and funeral orations. In spite of all the encouragement of the court, drama did not flourish in Sweden. Among the tragedians of the age we may mention Dalin, Gyllenberg, and Erik Wrangel (d. 1765). In comedy Reinhold Gustaf Modée (d. 1752) wrote three good plays in rivalry of Holberg. In science Linnæus, or Karl von Linné (1707-1778), was the name of greatest

genius in the whole century, but he wrote almost entirely in Latin. The two great Swedish chemists, Torbern Olof Bergman (1735-1784) and Karl Vilhelm Scheele (1742-1786), flourished at this time. In pathology a great name was left by Nils Rosén von Rosenstein (1706-1773), in navigation by Admiral Fredrik Henrik af Chapman (d. 1808), in philology by Karl Aurivillius (d. 1786). But these and other distinguished savants whose names might be enumerated scarcely belong to the history of Swedish literature. The same may be said about that marvellous and many-sided genius, Emanuel Swedenborg (1688-1772), who, though the son of a Swedish poet, preferred to prophesy to the world in Latin (see SWEDENBORG).

What is called the Gustavian period is supposed to commence with the reign of Gustavus III. in 1771 and to close with the abdication of Gustavus IV. in 1809. This period of less than forty years was particularly rich in literary talent, and the taste of the people in literary matters widened to a remarkable extent. Journalism began to develop, the Swedish Academy was founded, the drama first learned to flourish in Stockholm, and literature began to take a characteristically national shape. This fruitful period naturally divides itself into two divisions, equivalent to the reigns of the two kings. The royal personages of Sweden have commonly been protectors of literature, they have strangely often been able men of letters themselves. Gustavus III. (1746-1792), the founder of the Swedish Academy and of the Swedish theatre, was himself a playwright of no mean ability. One of his prose dramas, *Siri Brahe och Johan Gyllensjerna*, held the stage for many years. In 1773 the king opened the national theatre in Stockholm, and on that occasion an opera of *Thetis och Pelée* was performed, written by himself. In 1786 Gustavus created the Swedish Academy, on the lines of the French Academy, but with eighteen members instead of forty. The first list of immortals, which included the survivors of a previous age and such young celebrities as Kellgren and Leopold, embraced all that was most brilliant in the best society of Stockholm, the king himself presided, and won the first prize for an oration. The principal writers of the reign of Gustavus III. bear the name of the Academical school. But we must first consider a writer of genius who had nothing academical in his composition.

Karl Mikael Bellman (1740-1795), the most original Bellman and one of the most able of all Swedish writers, was an improvisatore of the first order (see BELLMAN). The riot of his dithyrambic hymns sounded a strange note of nature amid the conventional music of the Gustavians. Of the academical poets Johan Gabriel Oxenstjerna (1750-1818), the nephew of Gyllenberg, was a descriptive idyllist of grace. He translated *Paradise Lost*. A writer of far more power and versatility was Johan Henrik Kellgren (1751-1795), the leader of taste in his time (see KELLGREN). He was the first writer of the end of the century in Sweden, and the second undoubtedly was Karl Leopold. Gustaf af Leopold (1756-1829), “the blind seer Tiresias-Leopold,” who lived on to represent the old school in the midst of romantic times. Leopold was not equal to Kellgren in general poetical ability, but he is great in didactic and satiric writing. He wrote a satire, the *Enebomnad*, against a certain luckless Per Enebon, and a classic tragedy of *Virginia*. He is little read now. Gudmund Goran Adlerbeth (1751-1818) was a translator, and the author of a successful tragic opera, *Cora och Alonzo* (1782). Anna Maria Lenngren (1754-1817) was a very popular sentimental writer of graceful verse, chiefly between 1792 and 1798. She was less French and more national than most of her contemporaries, she is a Swedish Mrs Hemans.

Two writers of the academic period, besides Bellman, and a generation later than he, kept apart, and served to lead up to the romantic revival. Bengt Lidner (1759-1793), a melancholy and professedly elegiacal writer, had analogies with such German sentimentalists as Novalis. He led a strange wandering life, and died, still young, in extreme poverty. His poems appeared in 1788. Thorild (1739-1808) was a much stronger nature, and led the revolt against prevailing taste with far more vigour. But he is an irregular and inartistic versifier, and it is mainly as a prose writer, and especially as a very original and courageous critic, that he is now mainly remembered. He settled in Germany, and died as a professor in Greifswald. Karl August Ehrensvärd (1745-1800) may be mentioned here as a critic whose aims somewhat resembled those of Thorild. The creation of the Academy led to a great production of æsthetic and philosophical writing. Among critics of taste may be mentioned Nils von Rosenstein (1752-1824), the rhetorical bishop of Linköping, Magnus Lehnberg (1758-1808), and Count Georg Adlersparre (1760-1809). Kellgren and Leopold were both of them important prose writers.

The excellent lyrical poet Frans Mikael Franzén (1772-1847) (see FRANZEN), and a belated academician Johan David Valerius (1776-1852), fill up the space between the Gustavian period and the domination of romantic ideas from Germany. It was Lorenzo Hammarsköld (1785-1827) who in 1803 introduced the views of Tieck and Schelling by founding the society in Upsala called "Vitterhetens Vänner" (see HAMMARSKÖLD). This passed away, but was succeeded in 1807 by the famous "Aurora förbundet," founded by two youths of genius, Per Daniel Amadeus Atterbom (1790-1855) and Vilhelm Frederik Palmblad (1788-1852). These young men had at first to endure bitter opposition and ridicule from the academic writers then in power, but they supported this with cheerfulness, and answered back in their magazines, *Poeterna* and *Fosforerna* (1810-1813). They were named "Fosforisterna" (Phosphorists) from the latter. The principal members of the school were the three writers last named (see ATTERBOM) and Karl Fredrik Dahlgren (1791-1844), a humorist who owed much to the example of Bellman. Fru Julia Nyberg (1785-1854), under the title of Euphrosyno, was their tenth Muse, and wrote agreeable lyrics. Among the Phosphorists Atterbom was the man of most genius. On the side of the Academy they were vigorously attacked by Per Adam Wallinark (1777-1858). One of them, Atterbom, eventually forced the doors of the Academy itself.

In 1811 certain young men in Stockholm founded a society for the elevation of society by means of the study of Scandinavian antiquity. This was the Gothic Society, which began to issue the magazine called *Iduna* as its organ. Of its patriotic editors the most prominent was Erik Gustaf Geijer (1783-1847), but he was presently joined by a young man slightly older than himself, Esaias Tegnér (1782-1846), afterwards bishop of Västerås, the greatest of Swedish writers (see GEIJER and TEGNÉR). Even more enthusiastic than either in pushing to its last extreme the worship of ancient myths and manners was Per Henrik Ling (1776-1839), now better remembered as the father of gymnastic science than as a poet. The Gothic Society eventually included certain younger men than these—Arvid August Afzelius (1785-1871), the first editor of the Swedish folk-songs, Gustaf Vilhelm Gumelius (1789-1877), who has been somewhat pretentiously styled "The Swedish Walter Scott," author of the historical novel of *Tord Bonde*, Baron Bernhard von Beskow (1796-1868), lyricist and dramatist, and Karl August Nicander (1799-1839), a poet who approached

the Phosphorists in manner. The two great lights of the Gothic school are Geijer, mainly in prose, and Tegnér, in his splendid and copious verse. Johan Olof Wallin (1779-1839) may be mentioned in the same category, although he is really distinct from all the schools. He was archbishop of Upsala, and in 1819 he published the national hymn-book of Sweden, now officially used in all churches, of the hymns in this collection, one hundred and twenty-six are written by Wallin himself.

From 1810 to 1840 was the blossoming time in Swedish poetry, and there were several writers of distinguished merit who could not be included in either of the groups enumerated above. Second only to Tegnér in genius, the brief life and mysterious death of Erik Johan Stagnelius (1793-1823) have given a romantic interest to all that is connected with his name. His first publication was the epic of *Vladimir the Great* (1817), to this succeeded the romantic poem *Blanda*. His singular dramas, *The Bacchantes* (1822), *Sigurd Ring*, which was posthumous, and *The Martyrs* (1821), are esteemed by many critics to be his most original productions. His mystical lyrics, entitled *Liljor i Sharon* ("Lilies in Sharon"), and his sonnets, which are the best in Swedish, may be recommended as among the most delicate products of the Scandinavian mind. Stagnelius has been compared, and not improperly, to Shelley. Erik Sjöberg, who called himself "Vitalis" (1794-1828), was another gifted writer whose career was short and wretched. A volume of his poems appeared in 1820, they are few in number and all brief. His work divides itself into two classes—the one profoundly melancholy, the other witty or boisterous. Two humorous poets of the same period who deserve mention are Johan Anders Wadman (1777-1837), an improvisatore of the same class as Bellman, and Kristian Erik Fahlcrantz (1790-1866), bishop of Västerås, whose humorous polemical poem of *Noah's Ark* (1825) is a masterpiece.

Among the poets who have been mentioned above, the majority distinguished themselves also in prose. But the period was not one in which Swedish prose shone with any special lustre. The first presast of the time was, without question, the novelist Karl Jonas Ludvig Almqvist (1793-1866), around whose extraordinary personal character and career a mythical romance has already collected (see ALMQVIST). He was encyclopædic in his range, although his stories preserve most charm, on whatever subject he wrote his style was always exquisite. Frederik Cederborg (1784-1835) revived the comic novel in his *Uno von Träsenberg* and *Ottar Tralling*. The historical novels of Gumelius have already been alluded to. Swedish history supplied themes for the romances of Count Per Georg Sparre (1790-1871) and of Gustaf Henrik Mellin (1803-1876). But all these writers sink before the sustained popularity of the Finnish poetess Fredrika Bremer (1801-1865), whose stories have reached farther into the distant provinces of the world of letters than the writings of any other Swede except Tegnér (see BREMER). She was preceded by Sofia Zelow, afterwards Baroness von Knorring (1797-1848), who wrote a long series of aristocratic novels.

At the beginning of the romantic period a high position was taken as an independent thinker by Benjamin Högner (1767-1812), who owed much at the outset to Kant and Fichte. Geijer also distinguished himself in philosophical writing, but the most original of Swedish philosophers has been Kristofer Jakob Boström (1797-1866), a peripatetic talker, who wrote little, but whose system has been reduced to literature by K. Claesson (1827-1859), Professor Axel Nyblæus (b. 1821), and other disciples. A polemical writer of great talent was Magnus Jakob

Crusenstolpe (1795–1865), of whose work it has been said that "it is not history and it is not fiction, but something brilliant between the one and the other." As an historian of Swedish literature Per Wieselgren (1800–1877) has composed a valuable work, and he has made other valuable contributions to history and bibliography. In history we meet again with the great name of Geijer, with that of Jonas Hallenberg (1748–1834), and with that of Anders Magnus Strinnholm (1786–1862), whose labours in the field of Swedish history were extremely valuable. Geijer and Strinnholm prepared the way for the most popular and perhaps the greatest of all Swedish historians, Anders Fryxell (1795–1881), whose famous *Berättelser ur Svensk Historien* appeared in parts during a space of nearly sixty years, an extraordinary example of persistent and uninterrupted work. As a legal historian the first place is easily maintained by Karl Johan Schlyter (b 1795). Hans Jarta (1774–1847) was a statesman who wrote with vigour on economical subjects. In science it is only possible to mention the celebrated names of Jons Jakob Berzelius (1779–1848) the chemist, Elias Fries (1794–1878) the botanist, Karl Adolf Agardh (1785–1859) the physiologist, and Sven Nilsson (1787–1883) the palæontologist.

Runeberg In the generation which has just passed away, the first poet of Sweden, without a rival, was Johan Ludvig Runeberg (1804–1877), who divides with Tegnér the highest honour in Swedish literature (see RUNEBERG). The other leading verse writers were Karl Vilhelm Böttiger (1807–1878), the son-in-law and biographer of Tegnér, Johan Börjesson (1790–1866), the last of the Phosphorists, author of various romantic dramas, Vilhelm August von Braun (1813–1860), a humorous lyricist, "Tals Qualis," whose real name was Karl Vilhelm August Strandberg (1818–1877), and August Teodor Blanche (1811–1868), the popular dramatist. But Runeberg is the only great

poetic name of this period. In prose there was not even a Runeberg. Novel-writing was sustained at no very high level by Karl Anton Wetterbergh (b 1804), who called himself "Onkel Adam," by Emilie Carlén (b 1807), whose autobiography has lately appeared, by Oskar Patrick Sturzen-Becker, "Orvar Odd," (1811–1869), by August Blanche, and by Marie Sofia Schwartz (b 1819). Lars Johan Hierta (1801–1872) was the leading journalist, Johan Henrik Thomander, bishop of Lund (1798–1865), the greatest orator, Matthias Alexander Castrén (1813–1852) a prominent man of science, and Karl Gustaf af Forsell (1783–1848) the principal statistician of this not very brilliant period. Elias Lonnrot (1802–1884) is distinguished as the Finnish professor who discovered and edited the *Kalevala*. It is impossible to give an exhaustive list of names in so short a sketch as this.

Swedish literature is not in a very lively condition at the present time. The most popular living poet is the Finn, Zakris Topelius (b 1818). Of a higher artistic merit are the finished lyrics of Count Karl Snoilsky (b 1841). King Oscar II. (b 1829) is a genuine poet of the second order, as his father Charles XV was of the third. Karl David af Wirsén (b 1842) is an active writer on the conservative side. The best living author of Sweden is undoubtedly Viktor Rydberg (b 1829), who has written masterly novels and historical works. The latest influences from Denmark and France are beginning to be represented by Strindberg the novelist, and by Fru A. Oh. Edgren, the most successful Swedish dramatist of the moment. The revival of literature which has been so marked in the other two Scandinavian countries has not yet spread into Sweden.

SWEDENBORG, or SVEDBERG, EMANUEL (1688–1772), was born at Stockholm January 29, 1688. His father, Dr. Jesper Svedberg, subsequently professor of theology at Upsala and bishop of Skara, was a pious, learned, and a brave man, who did not escape the charge of heterodoxy, and believed himself to be in constant intercourse with angels. Emanuel shared as a child his father's piety, and his parents thought that "angels spoke through him." His education embraced the Latin, Greek, and Hebrew languages, and, above all, mathematics with the natural sciences, but seems to have been curiously defective in theology. Endowed with unusual intellectual powers and an iron constitution, he acquired vast stores of learning in all those branches. Having completed his university course at Upsala, in 1710 he commenced the customary European tour, visiting England, Holland, France, and Germany, studying especially natural philosophy, though alternating it with the composition of Latin verses, little of the poet as there was in his nature. In 1715 he returned to Upsala, and devoted himself to natural science and various engineering works. From 1716 to 1718 he published a scientific periodical, called *Dædalus Hyperboreus*, a record of mechanical and mathematical inventions and discoveries. In 1716 he was introduced to Charles XII, who appointed him assessor in the Swedish college of mine. Two years later he distinguished himself at the king's siege of Frederikshall by the invention of machines for the transport of boats and galleys overland from Stromstadt to Iddefjord, a distance of 14 English miles. The same year he published various mathematical and mechanical works. At the death of

Charles XII Queen Ulrica elevated him and his family to the rank of nobility, by which his name was changed from Svedberg to Swedenborg. The next years were devoted to the duties and studies connected with his office, which involved the visitation of the Swedish, Saxon, Bohemian, and Austrian mines. In 1724 he was offered the chair of mathematics in the university of Upsala, which he declined. Gradually his inquiring and philosophical mind led him to wider studies than those of his profession. As early as 1721 he was seeking to lay the foundation of a scientific explanation of the universe, when he published his *Prodromus Principiorum Rerum Naturalium* and had already written his *Principia* in its first form. Thirteen years later, in 1734, appeared in three volumes *Opera Philosophica et Mineralia*, the first volume of which (his *Principia*) contained his view of the first principles of the universe, a curious mechanical and geometrical theory of the origin of things. The same year followed *Prodromus Philosophiæ ratiocinantis de Infinito et Causa Finali Creationis*, which treats of the relation of the finite to the infinite and of the soul to the body, seeking to establish a nexus in each case as a means of overcoming the difficulty of their relation. From this time he applied himself to the problem of discovering the nature of soul and spirit by means of anatomical studies. He travelled in Germany, France, and Italy in quest of the most eminent teachers and the best books dealing with the human frame, and published, as the results of his inquiries, among other works, his *Economia Regni Animalis* (London, 1740–41) and *Regnum Animale* (The Hague, 1744–45, London, 1745). But a profound change was coming over

him, which was to make of the scientific inquirer the supernaturalist prophet. Neither by geometrical, nor physical, nor metaphysical principles had he succeeded in reaching and grasping the infinite and the spiritual, or in elucidating their relation to man and man's organism, though he had caught glimpses of facts and methods which he thought only required confirmation and development. Late in life he wrote to Oetinger that "he was introduced by the Lord first into the natural sciences, and thus prepared, and, indeed, from the year 1710 to 1744, when heaven was opened to him." This latter great event is described by him as "the opening of his spiritual sight," "the manifestation of the Lord to him in person," "his introduction into the spiritual world." Before his illumination he had been instructed by dreams, and enjoyed extraordinary visions, and heard mysterious conversations. According to his own account, the Lord filled him with His spirit to teach the doctrines of the New Church by the word from Himself. He commissioned him to do this work, opened the sight of his spirit, and so let him into the spiritual world, permitting him to see the heavens and the hells, and to converse with angels and spirits for years, but he never received anything relating to the doctrines of the church from any angel but from the Lord alone while he was reading the word (*The Christian Religion*, No 779). He elsewhere speaks of his office as principally an opening of the spiritual sense of the word. His friend Robsahm reports, from Swedenborg's own account to him, the circumstances of the first extraordinary revelation of the Lord, when He appeared to him and said, "I am God the Lord, the Creator and Redeemer of the world. I have chosen thee to unfold the spiritual sense of the Holy Scripture. I will Myself dictate to thee what thou shalt write." From that time he gave up all worldly learning, and laboured solely to expound spiritual things. But it was some time before he became quite at home in the spiritual world. In the year 1747 he resigned his post of assessor of the college of mines that he might devote himself to his higher vocation, requesting only to be allowed to receive as a pension the half of his salary. He took up afresh his study of Hebrew, and began his voluminous works on the interpretation of the Scriptures. The principal of these is the *Arcana Caelestia* in eight quarto volumes, which he printed in London between 1749 and 1756, professing to have derived the whole of it by direct illumination from the Almighty Himself, and not from any spirit or angel. His later work *De Caelo et de Inferno* (London, 1758) consists of extracts and portions of the *Arcana*. His MS work *Apocalypsis Explicata*, expounding the doctrines of the New Church, was prepared in 1757-59. In 1763 appeared his *Sapientia Angelica de Divino Amore et de Divina Sapientia*, containing the most philosophical brief account of the principles of the New Church. The long list of his subsequent writings will be found in the works mentioned below. His life from 1747 was spent alternately in Sweden, Holland, and London, in the composition of his works and their publication, till his death, which took place in London, March 29, 1772.

He was a man who won the respect, confidence, and love of all who came into contact with him. Though people might disbelieve in his visions, they feared to ridicule them in his presence. His manner of life was simple in the extreme, his diet consisted chiefly of bread and milk and large quantities of coffee. He paid no attention to the distinction of day and night, and sometimes lay for days together in a trance, while his servants were often disturbed at night by hearing what he called his conflicts with evil spirits. But his intercourse with spirits was often perfectly calm, in broad daylight, and with all his faculties awake. Three extraordinary instances are produced by his friends and followers in proof of his seership and admission into the unseen world. But there exists no account at first hand of the exact facts, and Swedenborg's own reference to one of these instances admits of another explanation than the supernatural one. The philosopher Kant was struck by them in 1763, but in 1765, after further inquiries, con-

cluded that two of them had "no other foundation than common report (*gemeine Sage*). See Kehrbaeh's edition of Kant's *Träume eines Geistessehers* (Leipzig, 1880).

Swedenborg's theosophic system is most briefly and comprehensively presented in his *Divine Love and Divine Wisdom*. The point of view from which God must be regarded is that of His being the Divine Man. His *esse* is infinite love, His manifestation, form, or body is infinite wisdom. Divine love is the self subsisting life of the universe. From God emanates a divine sphere, which appears in the spiritual world as a sun, and from this spiritual sun again proceeds the sun of the natural world. The spiritual sun is the source of love and intelligence, or life, and the natural sun the source of nature, or the receptacles of life, the first is alive, the second dead. The two worlds of nature and spirit are perfectly distinct, but they are intimately related by analogous substances, laws, and forces. Each has its atmospheres, waters, and earths, but in the one they are natural and in the other spiritual. In God there are three infinite and uncreated "degrees" of being, and in man and all things corresponding three degrees, finite and created. They are love, wisdom, use, or end, cause, and effect. The final ends of all things are in the Divine Mind, the causes of all things in the spiritual world, and their effects in the natural world. By a love of each degree man comes into conjunction with them and the worlds of nature, spirit, and God. The end of creation is that man may have this conjunction and become the image of his Creator and creation. In man are two receptacles for God,—the will for divine love and the understanding for divine wisdom,—that love and wisdom flowing into both so that they become human. Before the fall this influx was free and unhindered, and the conjunction of man with God and the creation complete, but from that time the connexion was interrupted and God had to interpose by successive dispensations. At last the power and influence of the spirits of darkness, with whom man associates himself by his sin, became so great that the existence of the human race was threatened, and Jehovah was necessitated to descend into nature to restore the connexion between Himself and man. He could not come in His unveiled Divinity, for the "hells" would have then perished, whom he did not seek to destroy but only to subjugate. Another purpose of Jehovah's incarnation was the manifestation of His divine love more fully than ever before. Swedenborg wholly rejects the orthodox doctrine of atonement, and the unity of God, as opposed to his idea of the trinity of the church, is an essential feature of his teaching. Another distinctive feature is that Jehovah did not go back to heaven without leaving behind Him a visible representative of Himself in the word of the Scripture. This word is an eternal incarnation, with its threefold sense—natural, spiritual, celestial. And Swedenborg is the divinely commissioned expounder of this threefold sense of the word, and so the founder of the New Church, the paraclete of the last dispensation. That he might perceive and understand the spiritual and the celestial senses of the word he enjoyed immediate revelation from the Lord, was admitted into the angelic world, and had committed to him the key of "correspondences" with which to unlock the divine treasures of wisdom. Swedenborg claimed also to have learnt by his admission into the spiritual world the true states of men in the next life, the scenery and occupations of heaven and hell, the true doctrine of Providence, the origin of evil, the sanctity and perpetuity of marriage, and to have been a witness of the "last judgment," or the second coming of the Lord, which took place in the year 1757. It was then that the New Church, or the New Jerusalem, was inaugurated, and Swedenborg claimed to be the divinely appointed prophet and teacher of its doctrines, and maintained that his revelations excel all that preceded them.

Swedenborgianism.—Swedenborgianism, as professed by Swedenborg's followers, is based on the belief of Swedenborg's claims to have witnessed the last judgment, or the second advent of the Lord, with the inauguration of the New Church through the new system of doctrine promulgated by him and derived from the Scriptures, into the true sense of which he was the first to be introduced. The doctrines of the New Church are those of the internal sense of the word as revealed to Swedenborg, who received them into his understanding and published them through the press and not as a preacher. They are briefly—(1) that the Lord Jesus Christ is the only God, that in Him there is the Trinity of Father, Son, and Holy Ghost, the Father being His infinite divine nature or soul, the Son His glorified human nature or divine body, and the Holy Spirit the life proceeding from His divine humanity for the salvation of man, (2) that the Father in His eternal humanity descended as the Lord Jesus Christ to the earth, assuming fallen human nature, that in it he might conquer hell and deliver mankind from its influence, (3) that the Sacred Scriptures are the true word of God, accommodated to the understanding of angels and men, and constituting the perpetual medium between heaven and the church, the law of correspondence having been revealed by the Lord to Swedenborg as the key for their interpretation, (4) that man is not saved by faith alone but by a life according to the word, the summary of faith alone but by a life according to the word, the summary of which is the decalogue, (5) that heaven is made up of those who

keep God's commandments and love Him and His kingdom, and hell of those who love themselves and the world, (6) that the spiritual world—heaven and hell—holds the same relation to the natural world and its inhabitants as the soul to the body, being in and around the natural world and its life, and that after the death of the body the spirit continues to live in the spiritual world it had previously though unconsciously inhabited. Swedenborgians now constitute a widely spread and considerable society, with a regularly constituted ecclesiastical organization and a zealous missionary activity. Soon after Swedenborg's death students of his works in England and Sweden began to translate them from the Latin and to spread his views. First in time and activity amongst these early Swedenborgians was the Rev. John Clowes, rector of St John's, Manchester, who translated the whole of several treatises. The first public meeting of Swedenborgians, from which dates the foundation of the society, was held in London December 5, 1783, and was attended by five persons. The separation of the society from the "old church" as a religious body, with its distinct creed, worship, and ecclesiastical organization, took place May 7, 1787, and its first place of worship was in Great Eastcheap, London. The first general conference of the New Church was held April 17, 1789, in this chapel, when a series of resolutions concerning the creed, the sacraments, and ecclesiastical order of the society were adopted. At the same time churches began to be formed in various towns in England and in America. Towards the end of the century Swedenborg's doctrines obtained a considerable degree of acceptance on the Continent, separate societies having arisen here and there. Meritum the Manchester Printing Society, under Mr. Clowes, printed and distributed Swedenborg's works in large numbers. In 1810 a London Printing Society was formed, which has been very active in the same way to the present time. In 1817 a convention of the American New Church was held in Philadelphia, which gave proof of the growth of the body in the United States. The same year the tenth general conference of the English section of the church was attended by twenty-seven delegates and ministers of various societies, and in 1821 there were upwards of fifty-two of these in Great Britain. At the general conference in 1835 it was reported that there were sixty-five societies or churches in Great Britain connected with the conference, having 5700 registered members, the net increase of the year being 119. The names of thirty-two ordained ministers appear in the report, the investments of the society amount to £60,453, and there are a dozen educational and missionary institutions in connexion with it. Some of the New Church day schools are amongst the largest and most efficient in the kingdom. From the same report it appears that the New Church has societies or institutions in most British colonies as well as in the principal countries of Europe. The report of the General Convention of the New Jerusalem in the United States, 1835, gives the names of 116 societies in America, with nearly the same number of ordinary ministers. In Italy, Sweden, and Prussia there is a Swedenborg mission sustained by help from England and America. In South Germany there exist congregations of the New Church, and the librarian of the university of Tübingen, Dr. Immanuel Tafel, was exceedingly active until his death (1863) in the publication and translation of Swedenborg's works, and in the vindication of the doctrines of the New Church. In Austria, Norway, and Switzerland also there are congregations. But, in addition to full converts to Swedenborgianism, a considerable number of prominent theologians and other thinkers have been attracted by Swedenborg's works and parts of his system. While the extravagant anthropomorphism, the mechanical materialism, the theological narrowness, the wild allegorizing, the entire absence of historical knowledge, and the astounding prophetic claims of the man and his system,—in a word, the Gnosticism of Swedenborg and his followers,—must be offensive to philosophical minds, they can discover in his writings and the drift of his thought fine ethical views, profound glances of insight into the depths of the universe,—God, nature, man, and his destiny. The names of Ostinger, Herder, Goerres, Coleridge, Emerson, J. D. Morell may be given as proof of this. Such thinkers were attracted by one or more of the dominant and pervading principles or tendencies of his extraordinary mind. For he felt, if he did not adequately expound, the harmony of the universe, the fundamental unity of being and thought, of knowledge and will, of the divine and the human, and his wild system of allegory, with his equally wild communications with the unseen world, failed to conceal a deep moral and intellectual revolt against the most irrational forms of traditional orthodoxy, while his deep spiritual nature spurned the shallow intellectualism of the rationalists of the 18th century.

Literature.—A rich collection of materials for a life of Swedenborg is Documents concerning the Life and Character of Swedenborg, Collected, Translated and Annotated by Dr. R. L. Tafel in 3 vols. Swedenborg Society, 1875-77. Of English lives the principal are—*Emanuel Swedenborg a Biography*, by J. J. G. Paxton Hood, London, 1854. *Swedenborg a Biography and an Exposition* by E. White, 1856, rewritten in 1867 and in 1868. *Emanuel Swedenborg the Spiritual Columbus a Sketch*, by U. S. E., 2d ed. London, 1877. A useful handbook of Swedenborg's theology, consisting of extracts in English from his numerous works, is the *Compendium of the Theological Writings of Emanuel Swedenborg*, by

the Rev. Samuel Warren, London, 1863. Brief summaries of his system and writings are given in all the above biographies and in Edmund Swift's *Manual of the Doctrines of the New Church*, London, 1866. Important critiques from independent points of view are: "Emanuel Swedenborg," in the *Respectable Review*, May 1850, "The Mystic" in Emerson's *Representative Men*, 1850, Kant's *Träume einer Geisteswissenschaft* 1787 (the best edition by K. L. Bach, Leipzig, 1850). Herder's "Emanuel Swedenborg," in his *Abhandlung über die Kunst des Geistes*, vol. xii pp. 110-115. Goethe's *Emanuel Swedenborg seine Zeit und sein Verhältniss zur Kirche*, 1857. Turner's *God's d. Pro. T. Co.*, Munich, 1857, pp. 62-67. For the history of Swedenborgianism see *Life and Progress of the New Jerusalem Church in England, America and Other Parts* by J. L. L. Marsh, edited by J. M. M. London, 1871. The chief apologetic work is *Swedenborg's Apology* 16th ed. 1851, London. See also *National Review*, April 1854. (3 L. S.)

SWILET POTATO See POTATO

SWIFT, a bird so called from the extreme speed of its flight, which apparently exceeds that of any other British species, the *Hirundo apus* of Linnæus and *Cypselus apus* or *minor* of modern ornithologists, who have at last learned that it has only an outward resemblance but no near affinity to the SWALLOW (*ante*, p. 729) or its allies. Well known as a summer visitor throughout the greater part of Europe, it is one of the first to return from Africa, and its stay in the country of its birth is of the shortest, for it generally disappears from England very early in August, though occasionally to be seen for even two months later.

The Swift commonly chooses its nesting place in hole under the eaves of buildings, but a cavity in the face of a quarry or even a hollow tree, will serve it with the accommodation it requires. This indeed is not much since very natural functions of flight, oviposition, and incubation, is performed on the wing, and the evolutionary of this bird in the air, when it remains for hours together, are the admiration of all who witness them. Though considerably larger than a Swallow, it can be recognized at a distance by its size than by its peculiar shape. The head scarcely projects from the anterior outline of the pointed wings, which form an almost continuous curve, at right angles to which extend the body and tail, resembling the handle of the cross-bite cutting knife used in several trades which it imitates at the blade. The mode of flight of the two birds is also unlike, that of the Swift being much more steady, and rapid as it is, ordinarily free from jerks. The whole plumage, except a grayish white patch under the chin is a sooty black, but glossy above. Though its actual breeding places are by no means numerous its extraordinary speed and distinctive habits make the Swift widely distributed, and throughout England scarcely a summer's day passes without its being seen in most places. A larger species, *C. melba* or *C. alpinus*, with the lower parts dusky white, which has its home in many of the mountainous parts of central and southern Europe, has several times been observed in Britain, and two examples of a species of a very distinct genus, *Acanthypus* (or *Chelidon*), which has its home in northern Asia, but regularly migrates thence to Australia, have been obtained in England (*Proc. Zool. Society*, 1850, p. 1).

Among other peculiarities the Swifts, as long ago described (probably from John Hunter's notes) by Home (*Phil. Trans.*, 1817, pp. 332 et seq., pl. xvi), are remarkable for the development of their salivary glands, the secretions of which serve in most species to glue together the materials of which the nests are composed, and in the species of the genus *Collocalia* form almost the whole substance of the structure. These are the "edible" nests so eagerly sought by Chinese cuisiniers as an ingredient for soup, and their composition, though announced many years since by Home (*ut supra*), whose statement was confirmed by Bernsten (*le Soc. Sc. Indo Néerlandica*, in Art. 5, and *Journ. für Ornithologie*, 1859, pp. 111-119), has of late been needlessly doubted in favour of the popular belief that they were made of some kind of seaweed, *Algae*, or other vegetable matter collected by the birds. It may be hoped that the examination and analysis made by Mr. J. R. Green (*Journ. of Physiology*, vi pp. 40-45) have settled that question for all time. These remarkable nests consist essentially of mucus, secreted by the salivary glands above mentioned, which dries and looks like isinglass. Their marketable value depends on their colour and purity, for they are often intermixed with feathers and other foreign substances. The Swifts that construct these "edible" nests form a genus *Collocalia*, of which the number of species is uncertain, but they inhabit chiefly the islands of the Indian Ocean from the north of Madagascar eastward, as well as many of the tropical

1 This species, *C. candacina* has been generally, but Mr. Hume says (*Strey's Flathers*, ix p. 230) wrongly, identified with the *Hirundo ciris* of Pallas. So many authors have recently ascribed the foundation of the genus *Chelidon* to Stephens in the year 1825 that it may not be amiss to state that its origin dates only from 1826, the same year in which Boie established the commensurate genus *teanthyllis*.

2 Hence one species has been called *Collocalia fuciphaga*.

islands of the Pacific so far as the Marquesas,—one species occurring in the hill-country of India. They breed in caves, to which they resort in great numbers, and occupy them jointly and yet alternately with Bats—the mammals being the lodgers by day and the birds by night.¹

The genus *Cypselus*, as noted by Willughby, with its American ally *Panyptila*, exhibits a form of pedal structure not otherwise observed among birds. Not only is the hind-toe constantly directed forwards, but the other three toes depart from the rule which ordinarily governs the number of phalanges in the Bird's foot,—a rule which applies to even so ancient a form as *Archaeopteryx* (see BIRDS, vol. III p. 728),—and in the two Cypseline genera just named the series of digital phalanges is 2, 3, 3, 3, instead of 2, 3, 4, 5, which generally obtains in the Class *Aves*. Other Swifts, however, do not depart from the normal arrangement, and the exception, remarkable as it is, must not be taken as of more value than is needed for the recognition of two sections or subgenera admitted by Mr Sclater in his monographical essay on the Family (*Proc Zool Society*, 1865, pp. 593–617). There seem to be about half a dozen good genera of *Cypselidae*, and from fifty to sixty species. Their geographical distribution is much the same as that of the *Hirundinidae* (cf. SWALLOW, *ut supra*), but it should be always and most clearly borne in mind that, though so like Swallows in many respects, the Swifts have scarcely any part of their structure which is not formed on a different plan, and, instead of any near affinity existing between the two groups, it can scarcely be doubted by any unprejudiced investigator that the *Cypselidae* not only differ far more from the *Hirundinidae* than the latter do from any other Family of *Passeres*, but that they belong to what in the present state of ornithology must be deemed a distinct Order of Birds—that which in the present series of articles has been called *Picaria*. That the relations of the *Cypselidae* to the *Trochilidae* (cf. HUMMING-BIRD, vol. III pp. 357 *sq.*) are close, as has been asserted by L'Hermínio and Nitzsch, Dr Burmeister and Prof Huxley, is denied by Dr Shufeldt (*Proc Zool Society*, 1885, pp. 886–914), but the views of the last have since been controverted by Mr F. Lucas (*Ibid.*, 1886, pp. 444–451). (A N)

SWIFT, JONATHAN (1667–1745), dean of St Patrick's, the greatest satirist of his own or perhaps of any age, was born in Hoey's Court, Dublin, November 30, 1667. Like Pope's, his family was of Yorkshire origin, in the time of Charles I the representative of one branch had obtained a peerage, which expired with him. The first of his own immediate ancestors known to us was a clergyman, rector of St Andrew's, Canterbury, from 1569 to 1592, whose son succeeded him in that living, and whose grandson was the Rev Thomas Swift, vicar of Goodrich in Herefordshire, renowned for his eccentricity, his mechanical ingenuity, and, above all, his stubborn devotion to Charles I and the persecutions he underwent in consequence. Plundered thirty-six times, and ultimately ejected from his living, he died in 1658, leaving his thirteen children a small and greatly impoverished landed estate and the questionable advantage of a substantial claim on the gratitude of the restored sovereign. More fortunate than most ruined cavaliers, his eldest son Godwin soon obtained the attorney-generalship of the palatinate of Tipperary. This piece of good fortune naturally attracted other members of the family across the channel,—among them Jonathan, one of the youngest of nine brothers, but already husband of Abigail Erioe of Leicester, a lady of ancient descent and means more limited than his own. A student of law, but

never called to the bar, Jonathan appears to have subsisted for some years on windfalls and casual employments. At length (1665) he became steward of the King's Inns (answering to the Inns of Court in England), an office of small emolument. Two years afterwards he died suddenly, leaving an infant daughter and a widow pregnant with the future dean of St Patrick's. So embarrassed had his circumstances been that, although considerable debts were owing to the estate, Mrs Swift was for the moment unable to pay the expense of his interment. Thus Swift's first experience of life was that of a dependant on the charity of his nucleus, more particularly of Godwin, and the inevitable bitterness of the situation was aggravated by the grudging manner in which the Tipperary official seemed to dole out his parsimonious help. In fact, the apparently prosperous relative was the victim of unfortunate speculations, and chose rather to be reproached with avarice than with imprudence. A virulent resentment became ingrained into the youth's whole nature, and, though ultimately acquainted with the real state of the case, he never mentioned his uncle with kindness or respect. Other relatives did more to merit his regard. Yet he took no pride in his Irish connexions or nativity, and a singular adventure in his infancy seems to have afforded him a pretext for insinuating that he was really born in England. When he was but two years old his nurse, a native of Whitehaven, was recalled to that town by an illness in her family. So attached had she become to her charge as to clandestinely carry him away with her. Mrs Swift was induced to consent to his remaining with her for a time, and the child spent three years in Cumberland. By his return his education had made considerable progress, and in the next year he was sent to the grammar school at Kilkenny. There can be no question as to the author of *Gulliver* having been a remarkable child, but unfortunately only one anecdote of his school-days has been preserved. It is the story, graphically narrated by himself, of his having once invested the whole of his pocket money in the purchase of an old horse condemned to the knacker's yard, his momentary triumph over his school-fellows, and his mortification on discovering the uselessness of his acquisition,—an anecdote highly characteristic of his daring pride and ambition, and from which, instead of the moral he professed to discover, he might have derived an augury of the majestic failure of his life.

In April 1682 Swift matriculated at Trinity College, Dublin, where he failed to distinguish himself. "By the ill-treatment of his nearest relations," he says, meaning especially his uncle Godwin, "he was so discouraged and sunk in his spirits that he too much neglected his academic studies, for some part of which he had no great relish by nature, so that when the time came for taking his degree as bachelor of arts he was stopped of his degree for dulness and insufficiency, and at last hardly admitted in a manner little to his credit, which is called in that college *speciali gratia*, February 15, 1685." The college roll, nevertheless, shows that the only subject in which Swift absolutely failed was natural philosophy, including mathematics, in which the future author of the *Voyage to Laputa* was hardly likely to excel, nor is it surprising that a student of fitful and unruly temperament should have performed his obligatory theme *negligenter*. His examination in Greek and Latin was satisfactory, and the extent of desultory information evinced by his writings seems to prove that he had always been an industrious reader. His mortification made him reckless, and he repeatedly underwent academic censure during the next three years, though it is not certain whether some of the records supposed to apply to him do not in fact relate to his cousin Thomas.

¹ Mr H. Prver has given one of the latest accounts of some of these caves in North Borneo (*Proc Zool Society*, 1885, pp. 532–538), which may be read to advantage.

Swift and
Temple

In 1688 Swift quitted the university, and, after a brief residence with his mother at Leicester, entered the family of Sir William Temple at Moor Park, near Farnham, as he declares for the advantage of Temple's conversation, but at least partly as an amanuensis. A distant relationship between his mother and Lady Temple appears to have recommended him to this post, which he found trying to his pride and independence. Temple was, as Swift admitted, "a man of sense and virtue," but his temper was exclusive, his manners formal, and he had retired from public affairs from self-regard and over-fastidiousness. If he solaced his voluntary ostracism by a comparison with the elegant retirement and lettered ease of Cicero, it did not therefore occur to him to compare his obscure Irish secretary with the Roman orator's amanuensis Tiro, who had, at least, invented shorthand. We, who know that in the patron's place the dependant would have governed the nation, need not be surprised at finding, full twenty years afterwards, the iron of servitude still ranking in the latter's haughty soul. He withdrew from Temple's service on a pretext of ill health from May 1690 to August 1691, but returned, and undoubtedly made himself useful to his employer, who on one occasion rendered him the medium of a confidential communication to King William, who had consulted Temple on the bill for triennial parliaments, then sanctioned by both branches of the legislature. Swift did his best to enforce Temple's arguments in favour of the measure, and was in after life wont to refer to the failure of his rhetoric as the most useful lesson his vanity had ever received. Struck, it would seem, rather by the physical than the mental endowments of the robust young Irishman, William offered him a troop of horse, a proposal which appears to have been subsequently commuted into a promise of church preferment. Swift had already (July 1692) proceeded to the degree of M.A. at Oxford, and the execution of his design to embrace the ecclesiastical profession was hastened by a quarrel with Temple, occasioned by the latter's reluctance to contract any definite engagement to provide for him. Throwing up his employment, he passed (May 1694) over into Ireland, but found his views impeded by the refusal of all the bishops to ordain him without some certificate of the regularity of his deportment while in Temple's family. Five months passed ere he could bring himself to solicit this favour from his old patron, which he ultimately did in a letter submissive in appearance, but charged to the full with smothered rage and intense humiliation. Forgiveness was easy to one in Temple's place and of Temple's disposition, and he not only despatched the requisite testimonials, but added a recommendation which obtained for Swift the living of Kilroot, in the diocese of Down and Connor (January 1695). His residence here was not fated to be of long duration. Temple, who knew his value and had not parted with him willingly, soon let him understand that a return was open to him, and Swift, whose resentment was cooled by time, and soothed by the acknowledgment of his value to his patron, readily complied (May 1696). He continued to reside with Sir William till the latter's death in January 1699. No further disagreement troubled their intimacy, and Temple bequeathed Swift the charge of editing his writings, a laborious but not an unprofitable commission.

Early
writings-
and settle-
ment in
Ireland

Macaulay has justly indicated the familiarity with public affairs acquired by Swift at Moor Park as one main cause of his subsequent distinction as a politician, and here too he laid the foundation of his literary renown. He is reported to have read regularly for eight hours every day, and we have his own authority for his having, as early as 1691, "written and burned, and written again, more on all manner of subjects than perhaps any man in England." The only relics of these early days, however, belong to a

species of composition in which he was little qualified to excel. He has, indeed, a name among the poets of England, but the merit of his verse is usually in the ratio of its approach to the *sermo pedestris*. Mistaking the nature of his powers, he must needs begin with Pindaric, and the result may be imagined. Yet his own simple account of his feelings while endeavouring composition proves that the mood was right though the channel was wrong and that there was error as well as truth in his Irishman Dryden's severe and unforgotten remark, "Cousin Swift, you will never be a poet." Swift's first prose composition betrayed his resentment. In the *Battle of the Books* (1697), a satirical contribution to the controversy on the comparative merits of the ancients and the moderns raised by Perrault, but with especial reference to the question of the genuineness of the letters of Phalaris, on which his patron Temple had taken the wrong side, Swift for the first and last time committed a plagiarism, and sought to conceal it by an untruth. It is undoubtedly adapted, though certainly improved from, De Callieres's *Histoire Poétique de la Guerre nouvellement déclarée entre les Anciens et les Modernes*. Here also his sarcasm for the first and last time recoiled upon himself. The satire against Dryden and Bentley wants, indeed, nothing but truth to be excellent, but the pictures of the former in his monstrous helmet and the latter in his patchwork mail yield in ludicrousness to the idea of the author of the *Pindaric Odes* presuming to ridicule the author of *Abraham and Achitophel*, and the inglorious student of Trinity College, Dublin, challenging the first philologist of the age on a question of classical scholarship. It is, however, to his credit that his learning was greater than that of the other writers on his side and his pretensions less. Swift's next literary labour was his edition of Temple's posthumous works, already mentioned. They appeared with a dedication to King William, which was to have made the editor a prebendary. A petition to this effect miscarried, as he always believed, through the negligence or ill-will of the nobleman who undertook to present it. Be this as it may, he had become too important to be overlooked, and soon obtained the post of secretary and chaplain to Earl Berkeley, one of the lords justices of Ireland. The better half of this appointment, however, escaped him on his arrival in that country, his secretaryship being transferred to a Mr Bushe, who, when Lord Berkeley had at length an opportunity of recompensing Swift's disappointment by the gift of the deanery of Derry, successfully exerted his influence in favour of another clergyman, who is asserted to have gained his interest by the judicious outlay of a thousand pounds. With bitter indignation Swift threw up his chaplaincy, but was ultimately reconciled to his patron by the presentation to the rectory of Agher, in Meath, with the united vicarages of Laracor and Rathbeggan. For the first time in his life he might now call himself his own master, and had an opportunity of exhibiting, free from suspicion of external constraint, that stern regard to duty which was not the least prominent feature of his character. In an age of general laxity—in a priest of an alien church, whose most energetic servants commonly succumbed to the mortifying conviction of their uselessness and the detestation they excited among the people for whom they laboured, the parishioners of Laracor found a clergyman whom they might have heard three times a week. The energy, however, which probably gained the respect, certainly failed to influence the convictions, of his Catholic flock. We have his own authority for reckoning his average congregation at "half a score", and on one occasion his clerk Roger was his only auditor. In fact, his exertions in the pulpit were more meritorious than his achievements, he entirely lacked the fire, the self oblivion, the expansive

geniality of the orator. He himself characterized his discourses as "pamphlets," and, if meant to imply their arid and argumentative character, the criticism is just. The author of the *Tale of a Tub*, which he had had by him since 1696 or 1698, must have felt conscious of powers capable of far more effective exercise, and his resolution to exchange divinity for politics must appear fully justified on a comparison of these inconclusive essays with another performance of the same period. The *Discourse on the Dissensions in Athens and Rome* (September 1700), written in the Whig interest, "without humour and without satire," and intended as a dissuasive from the pending impeachment of Somers and three other noblemen, received the honour, extraordinary for the maiden publication of a young politician, of being generally attributed to Somers himself or to Burnet, the latter of whom found a public disavowal necessary. Three years and a half later appeared a more remarkable work. Clearness, cogency, masculine simplicity of diction, are conspicuous in the pamphlet, but true creative power told the *Tale of a Tub*. "Good God! what a genius I had when I wrote that book!" was his own exclamation in his latter years. It is, indeed, if not the most amusing of Swift's satirical works, the most strikingly original, and the one in which the compass of his powers is most fully displayed. In his kindred productions he relies mainly upon a single element of the humorous,—logical sequence and unflinching gravity bridling in an otherwise frantic absurdity, and investing it with an air of sense. In the *Tale of a Tub* he lashes out in all directions. The humour, if less cogent and cumulative, is richer and more varied, the invention too, is more daringly original and more completely out of the reach of ordinary faculties. The supernatural coats and the quintessential loaf may be paralleled but cannot be surpassed, and the book is throughout a mine of suggestiveness, as, for example, in the anticipation of Carlyle's clothes philosophy within the compass of a few lines. At the same time it wants unity and coherence, it attains no conclusion, and the author abuses his digressive method of composition and his convenient fiction of hiatuses in the original manuscript. The charges it occasioned of profanity and irreverence were natural, but groundless. There is nothing in the book inconsistent with Swift's professed and real character as a sturdy Church of England parson, who accepted the doctrines of his church as an essential constituent of the social order around him, battled for them with the fidelity of a soldier defending his colours, and held it no part of his duty to understand, interpret, or assimilate them.

Whig
connex-
ions,
pam-
phlets
on the
church

Before the publication of the *Tale of a Tub*, Swift had taken a step destined to exercise a most important influence on his life, by inviting two ladies to Laracor. Esther Johnson, a dependant of Sir William Temple's (born in March 1681), whose acquaintance he had made in the latter's family, and whom he has immortalized as "Stella,"¹ came over with her chaperon, Mrs Dingley, and was soon permanently domiciled in his neighbourhood. The melancholy tale of Swift's attachment will be more conveniently narrated in another place, and is only alluded to here for the sake of chronology. Meanwhile the sphere of his intimacies was rapidly widening. He had been in England for three years together, 1701 to 1704, and counted Pope, Steele, and Addison among his friends. The success of his pamphlet gained him ready access to all Whig circles,

¹ The name "Stella" is simply a translation of Esther. Swift may have learned that Esther means "star" from the *Elementa Linguae Persicæ* of John Greaves or from some Persian scholar, but he is more likely to have seen the etymology in the form given from Jewish sources in Buxtorf's *Lexicon*, where the interpretation takes the more suggestive form "Stella Veneris."

but already his confidence in that party was shaken, and he was beginning to meditate that change of sides which has drawn down upon him so much but such unjustifiable obloquy. The true state of the case may easily be collected from his next publications—*The Sentiments of a Church of England Man*, and *On the Reasonableness of a Test* (1708). The vital differences among the friends of the Hanover succession were not political, but ecclesiastical. From this point of view, Swift's sympathies were entirely with the Tories. As a minister of the church he felt his duty and his interest equally concerned in the support of her cause, nor could he fail to discover the inevitable tendency of Whig doctrines, whatever caresses individual Whigs might bestow on individual clergymen, to abase the Establishment as a corporation. He sincerely believed that the ultimate purpose of freethinkers was to escape from moral restraints, and he had an unreasoning antipathy to Scotch Presbyterians and English Dissenters. One of his pamphlets, written about this time, contains his recipe for the promotion of religion, and is of itself a sufficient testimony to the extreme materialism of his views. Censorships and penalties are among the means he recommends. His pen was exerted to better purpose in the most consummate example of his irony, the *Argument against Abolishing Christianity*. About this time, too (November 1707), he produced his best poem, *Baucis and Philemon*, which, as he frankly tells us, owes very much to the corrections of Addison.

From February 1708 to April 1709 Swift was in London, urging upon the Godolphin administration the claims of the Irish clergy to the first-fruits and tenths ("Queen Anne's bounty"), already granted to their brethren in England. His having been selected for such a commission shows that he was not yet regarded as a deserter from the Whigs, although the ill success of his representations probably helped to make him one. By November 1710 he was again domiciled in London, and writing his *Journal to Stella*, that unique exemplar of a giant's playfulness, "which was written for one person's private pleasure and has had indestructible attractiveness for every one since." In the first pages of this marvelously minute record of a busy life we find him depicting the decline of Whig credit and complaining of the cold reception accorded him by Godolphin, whose penetration had doubtless detected the precariousness of his allegiance. Within a few weeks he had become the lampooner of the fallen treasurer, the bosom friend of Oxford and Bolingbroke, and the writer of the *Examiner*, a journal established as the exponent of Tory views (November 1710). He was now a power in the state, the intimate friend and recognized equal of the first writers of the day, the associate of ministers on a footing of perfect cordiality and familiarity. "We were determined to have you," said Bolingbroke to him afterwards, "you were the only one we were afraid of." He gained his point respecting the Irish endowments, and, by his own account, his credit procured the fortune of more than forty deserving or undeserving clients. The envious but graphic description of his demeanour conveyed to us by Bishop Kennet attests the real dignity of his position no less than the airs he thought fit to assume in consequence. The cheerful, almost jovial, tone of his letters to Stella evinces his full contentment, nor was he one to be moved to gratitude for small mercies. He had it, in fact, fully in his own power to determine his relations with the ministry, and he would be satisfied with nothing short of familiar and ostentatious equality. His advent marks a new era in English political life, the age of public opinion, created indeed by the circumstances of the time, but powerfully fostered and accelerated by him. By a strange but not unfrequent

irony of fate the most imperious and despotic spirit of his day laboured to enthrone a power which, had he himself been in authority, he would have utterly detested and despised. For a brief time he seemed to resume the whole power of the English press in his own pen and to guide public opinion as he would. His services to his party as writer of the *Examiner*, which he quitted in July 1711, were even surpassed by those which he rendered as the author of telling pamphlets, among which *The Conduct of the Allies* and *Remarks on the Barrier Treaty* (November and December 1711) hold the first rank. In truth, however, he was lifted by the wave he seemed to command. Surfeited with glory, the nation wanted a convenient excuse for relinquishing a burdensome war, which the great military genius of the age was suspected of prolonging to fill his pockets. The Whigs had been long in office. The High Church party had derived great strength from the Sacheverell trial. Swift did not bring about the revolution with which, notwithstanding, he associated his name. There seems no reason to suppose that he was consulted respecting the great Tory strokes of the creation of the twelve new peers and the dismissal of Marlborough (December 1711), but they would hardly have been ventured upon if *The Conduct of the Allies* and the *Examiners* had not prepared the way. A scarcely less important service was rendered to the ministry by his *Letter to the October Club*, artfully composed to soothe the impatience of Harley's extreme followers. He had every claim to the highest preferment that ministers could give him, but his own pride and prejudice in high places stood in his way.

Swift made dean of St Patrick's, fall of the Tory ministry

Generous men like Oxford and Bolingbroke cannot have been unwilling to reward so serviceable a friend, especially when their own interest lay in keeping him in England. Notwithstanding, therefore, some dubious expressions in Swift's letters, natural to the deferred hope, we need not doubt their having actually used their best efforts to obtain for him the vacant see of Hereford. Swift, however, had formidable antagonists in the archbishop of York, whom he had scandalized, and the duchess of Somerset, whom he had satirized. Anne was particularly amenable to the influence of priestly and female favourites, and it must be considered a proof of the strong interest made for Swift that she was eventually persuaded to appoint him to the deanery of St Patrick's, Dublin, vacant by the removal of Bishop Sterne to Dromore. It is to his honour that he never speaks of the queen with resentment or bitterness. In June 1713 he set out to take possession of his dignity, and encountered a very cold reception from the Dublin public. The dissensions between the chiefs of his party speedily recalled him to England. He found affairs in a desperate condition. The queen's demise was evidently at hand, and the same instinctive good sense which had ranged the nation on the side of the Tories, when Tories alone could terminate a fatiguing war, rendered it Whig when Tories manifestly could not be trusted to maintain the Protestant succession. In any event the occupants of office could merely have had the choice of risking their heads in an attempt to exclude the elector of Hanover, or of waiting patiently till he should come and eject them from their posts, yet they might have remained formidable could they have remained united. To the indignation with which he regarded Oxford's refusal to advance him in the peerage the active St John added an old disgust at the treasurer's pedantic and dilatory formalism, as well as his evident propensity, while leaving his colleague the fatigues, to engross for himself the chief credit of the administration. Their schemes of policy diverged as widely as their characters. Bolingbroke's brain teemed with the wildest plans, which Oxford might have more effectually dis-

countenanced had he been prepared with anything in their place. Swift's endeavours after an accommodation were as fruitless as unremitting. His mortification was little likely to temper the habitual virulence of his pen, which rarely produced anything more acrimonious than the attacks he at this period directed against Burnet and his former friend Steele. One of his pamphlets against the latter (*The Public Spirit of the Whigs*) was near involving him in a prosecution, some invectives against the Scots having proved so exasperating to the peers of that nation that they repaired in a body to the queen to demand the punishment of the author, of whose identity there could be no doubt, although, like all Swift's writings, except the *Proposal for the Extension of Religion*, the pamphlet had been published anonymously. The immediate withdrawal of the offensive passage, and a sham prosecution instituted against the printer, extricated Swift from his danger.

Meanwhile the crisis had arrived, and the discord of Oxford and Bolingbroke had become patent to all the nation. Foreseeing, as is probable, the impending fall of the former, Swift retired to Upper Letcombe, in Berkshire, and there spent some weeks in the strictest seclusion. This leisure was occupied in the composition of his remarkable pamphlet, *Free Thoughts on the State of Public Affairs*, which indicates his complete conversion to the bold policy of Bolingbroke. The utter exclusion of Whigs as well as Dissenters from office, the remodelling of the army, the imposition of the most rigid restraints on the heir to the throne,—such were the measures which, by recommending, Swift tacitly admitted to be necessary to the triumph of his party. If he were serious, it can only be said that the desperation of his circumstances had momentarily troubled the lucidity of his understanding, if the pamphlet were merely intended as a feeler after public opinion, it is surprising that he did not perceive how irretrievably he was running his friends in the eyes of all moderate men. Bolingbroke's daring spirit, however, recoiled from no extreme, and, fortunately for Swift, he added so much of his own to the latter's MS that the author was obliged to recall a production which might not improbably have cost him his liberty and his deanery. This incident but just anticipated the revolution which, after Bolingbroke had enjoyed a three days' triumph over Oxford, drove him into exile and prostrated his party, but enabled Swift to perform the noblest action of his life. Almost the first acts of Bolingbroke's ephemeral premiership were to order him a thousand pounds from the exchequer and despatch him the most flattering invitations. The same post brought a letter from Oxford, soliciting Swift's company in his retirement, and, to the latter's immortal honour, he hesitated not an instant in preferring the solace of his friend to the offers of St John. When, a few days afterwards, Oxford was in prison and in danger of his life, Swift begged to share his captivity, and it was only on the offer being declined that he finally directed his steps towards Ireland, where he was very ill received. The draft on the exchequer was intercepted by the queen's death.

These four busy years of Swift's London life had not been entirely engrossed by politics. First as the associate friend of Steele, with whom he quarrelled, and of Addison, whose esteem for him survived all differences, afterwards as the intimate comrade of Pope and Arbuthnot, the friend of Congreve and Atterbury, Parnell and Gay, he entered deeply into the literary life of the period. He was treasurer and a leading member of the Brothers, a society of wits and statesmen which recalls the days of Horace and Mæcenas. He promoted the subscription for Pope's *Homer*, contributed some numbers to the *Tatler*, *Spectator*, and *Intelligencer*, and joined with Pope and Arbuthnot in

writings.

establishing the Scriblerus Club, writing *Martinus Scriblerus*, his share in which can have been but small, as well as *John Bull*, where the chapter recommending the education of all blue-eyed children in depravity for the public good must surely be his. His fugitive productions during this period are very numerous, and mostly distinguished not only by pungent wit but by overflowing animal spirits. The most celebrated are the cruel but irresistibly ludicrous satires on the astrologer Partridge, a man in fact respectable for his sincere belief in his art, and no mean writer. Many of his best poems belong to this period. A more laboured work, his *Memorial to Harley*, proposing the regulation of the English language by an academy, is chiefly remarkable as a proof of the deference paid to French taste by the most original English writer of his day. His *History of the Last Four Years of Queen Anne* is not on a level with his other political writings. To sum up the incidents of this eventful period of his life, it was during it that he lost his mother, always loved and dutifully honoured, by death, his sister had been estranged from him some years before by an imprudent marriage, which, though making her a liberal allowance, he never forgave.

Stella and
Vanessa.

The change from London to Dublin can seldom be an agreeable one. To Swift it meant for the time the fall from unique authority to absolute insignificance. All share in the administration of even Irish affairs was denied him, every politician shunned him, and his society hardly included a single author or wit. At a later period he talked of "dying of rage, like a poisoned rat in a hole", for some time, however, he was buoyed up by feeble hopes of a restoration to England. So late as 1726 he was in England making overtures to Walpole, but he had no claim on ministerial goodwill, and as an opponent he had by that time done his worst. By an especial cruelty of fate, what should have been the comfort became the bane of his existence. We have already mentioned his invitation of Esther Johnson and Mrs Dingley to Ireland. Both before and after his elevation to the deanery of St Patrick's these ladies continued to reside near him, and superintended his household during his absence in London. He had frustrated a match proposed for Stella, and, with his evident delight in the society of the dark-haired, bright-eyed, witty beauty, a model, if we may take his word, of all that woman should be, it seemed unaccountable that he did not secure it to himself by the expedient of matrimony. A constitutional infirmity has been suggested as the reason, and the conjecture derives support from several peculiarities in his writings. But, whatever the cause, his conduct proved none the less the fatal embitterment of his life and Stella's and yet another's. He had always been unlucky in his relations with the fair sex. In 1694 he had idealized as "Varina" a Miss Waring, who then discouraged his attentions, but two years later made him advances in her turn. Swift's mind had also changed, and he could find no better way out of the difficulty than an insulting letter affecting to accept her proposal on terms which he knew must put it out of the question. Varina was avenged by Vanessa, who pursued Swift to far other purpose. Esther Vanhomrigh, the orphan daughter of a commissioner of Irish trade, had become known to Swift at the height of his political influence. He lodged close to her mother, and was a frequent guest at her table. Vanessa insensibly became his pupil, and he insensibly became the object of her impassioned affection. Her letters reveal a spirit full of ardour and enthusiasm, and warped by that perverse bent which leads so many women to prefer a tyrant to a companion. Swift, on the other hand, was devoid of passion. Of friendship, even of tender regard, he was fully capable, but not of love. The spiritual realm, whether in divine or earthly things, was a region closed to

him, where he never set foot. As a friend he must have greatly preferred Stella to Vanessa, and from this point of view his loyalty to the original object of his choice, we may be sure, never faltered. But Vanessa assailed him on a very weak side. The strongest of all his instincts was the thirst for imperious domination. Vanessa hugged the fetters to which Stella merely submitted. Flattered to excess by her surrender, yet conscious of his binding obligations and his real preference, he could neither discard the one beauty nor desert the other. It is humiliating to human strength and consoling to human weakness to find the Titan behaving like the least resolute of mortals, seeking refuge in temporizing, in evasion, in fortuitous circumstance. He no doubt trusted that his removal to Dublin would bring relief, but here again his evil star interposed. Vanessa's mother died (1714), and she followed him. Unable to marry Stella without destroying Vanessa, or to openly welcome Vanessa without destroying Stella, he was thus involved in the most miserable embarrassment, still, for a time he continued to temporize. At length, unable to bear any more Stella's mute reproach and his own consciousness of wrong, he gave a reluctant consent to a private marriage, which, as at least the weight of testimony seems to prove, though there is no documentary evidence, was accordingly performed. This was in 1716. At the same time he insisted on their union being kept a strict secret, justifying a demand really dictated by tenderness for Vanessa, and perhaps by the unavonable reason to which allusion has been made, on the most futile and frivolous pretexts. Never more than a nominal wife, the unfortunate Stella commonly passed for his mistress till the day of her death, bearing her doom with uncomplaining resignation, and consoled in some degree by unquestionable proofs of the permanence of his love, if his feeling for her deserves the name. Meanwhile his efforts were directed to soothe Miss Vanhomrigh, to whom he addressed *Cadenus* [*Decanus*] and *Vanessa*, the history of their attachment and the best example of his serious poetry, and for whom he sought to provide honourably in marriage, without either succeeding in his immediate aim or in thereby opening her eyes to the hopelessness of her passion. In 1717, probably at his instance, she retired from Dublin to Marley Abbey, her seat at Celbridge. For three years she and Swift remained apart, but in 1720, on what occasion is uncertain, he began to pay her regular visits. Sir Walter Scott found the Abbey garden still full of laurels, several of which she was accustomed to plant whenever she expected Swift, and the table at which they had been used to sit was still shown. But the catastrophe of her tragedy was at hand. Worn out with his evasions, she at last (1723) took the desperate step of writing to Stella, or according to another account to Swift himself, demanding to know the nature of the connexion with him, and this terminated the melancholy history as with a clap of thunder. Stella replied by the avowal of her marriage, sent her rival's letter to Swift, and retired to a friend's house. Swift rode down to Marley Abbey with a terrible countenance, petrified Vanessa by his frown, and departed without a word, flinging down a packet which only contained her own letter to Stella. Vanessa died within a few weeks. She left the poem and correspondence for publication. The former appeared immediately, the latter was suppressed until it was published by Sir Walter Scott.

Five years afterwards Stella followed Vanessa to the grave. The grief which the gradual decay of her health evidently occasioned Swift is sufficient proof of the sincerity of his attachment, as he understood it. It is a just remark of Thackeray's that he everywhere half-consciously recognizes her as his better angel, and dwells on her wit

and her tenderness with a fondness he never exhibits for any other topic. Yet he could never overcome his repugnance to acknowledge their union till she lay on her death-bed, when he was heard by Mrs Whiteway (his cousin, a lady of fortune and talent, who, though not residing with him, superintended his household during his latter years) to say, "Well my dear, if you wish it, it shall be owned." She answered, "It is too late." On January 28, 1728, she died, and her wretched lover sat down the same night to record her virtues in language of unsurpassed simplicity, but to us who know the story more significant for what it conceals than for what it tells. A lock of her hair is preserved, with the inscription in Swift's handwriting, most affecting in its apparent cynicism, "Only a woman's hair!" "Only a woman's hair," comments Thackeray, "only love, only fidelity, purity, innocence, beauty, only the tenderest heart in the world stricken and wounded, and passed away out of reach of pangs of hope deferred, love insulted, and pitiless desertion, only that lock of hair left, and memory, and remorse, for the guilty, lonely wretch, shuddering over the grave of his victim." The more unanswerable this tremendous indictment appears upon the evidence the greater the probability that the evidence is incomplete. *Tout comprendre c'est tout pardonner*. The hypothesis to which we have referred must for ever remain an hypothesis, but better than any other it not only excuses but explains.

The
Drapier's
letters.

Between the death of Vanessa and the death of Stella, as though withheld by an evil fate until he could no longer enjoy them, came the greatest political and the greatest literary triumph of Swift's life. He had fled to Ireland a broken man, to all appearance politically extinct, a few years were to raise him once more to the summit of popularity, though power was for ever denied him. With his fierce hatred of what he recognized as injustice, it was impossible that he should not feel exasperated at the gross misgovernment of Ireland for the supposed benefit of England, the systematic exclusion of Irishmen from places of honour and profit, the spoliation of the country by absentee landlords, the deliberate discouragement of Irish trade and manufactures. An Irish patriot in the strict sense of the term he was not, he looked upon the indigenous population as conquered savages, but his pride and sense of equity alike revolted against the stay-at-home Englishmen's contemptuous treatment of their own garrison, and he delighted in finding a point in which the triumphant faction was still vulnerable. His *Proposal for the Universal Use of Irish Manufactures*, published anonymously in 1720, urging the Irish to disuse English goods, became the subject of a prosecution, which at length had to be dropped. A greater opportunity was at hand. One of the chief wants of Ireland in that day, and for many a day afterwards, was that of small currency adapted to the daily transactions of life. Questions of coinage occupy a large part of the correspondence of the primate, Archbishop Boulter, whose anxiety to deal rightly with the matter is evidently very real and conscientious. There is no reason to think that the English ministry wished otherwise, but secret influences were at work, and a patent for supplying Ireland with a coinage of copper halfpence was accorded to William Wood on such terms that the profit accruing from the difference between the intrinsic and the nominal value of the coins, about 40 per cent, was mainly divided between him and the duchess of Kendal, the king's mistress, by whose influence he had obtained the privilege. Swift now had his opportunity, and the famous letters signed M B Drapier (1724) soon set Ireland in a flame. Every effort was used to discover, or rather to obtain legal evidence against, the author, whom, Walpole was assured, it would then have

taken ten thousand men to apprehend. None could be procured, the public passion swept everything before it, the patent was cancelled, Wood was compensated by a pension, Swift was raised to a height of popularity which he retained for the rest of his life, and the only real sufferers were the Irish people, who lost a convenience so badly needed that they might well have afforded to connive at Wood's illicit profits. Perhaps, however, it was worth while to teach the English ministry that not everything could be done in Ireland. Swift's pamphlets, written in a style more level with the popular intelligence than even his own ordinary manner, are models alike to the controversialist who aids a good cause and to him who is burdened with a bad one. The former may profit by the study of his marvellous lucidity and vehemence, the latter by his sublime audacity in exaggeration and the sophistry with which he involves the innocent halfpence in the obloquy of the nefarious patentee.

The noise of the Drapier's letters had hardly died away *Gulliver's Travels*.

when Swift acquired a more durable glory by the publication of *Gulliver's Travels* in 1726. The work had been at least partly written by 1722, and the keenness of the satire on courts and statesmen suggests that it was planned while Swift's disappointments as a public man were still ranking and recent. It is Swift's peculiar good fortune that his book can dispense with the interpretation of which it is nevertheless susceptible, and may be equally enjoyed whether its inner meaning is apprehended or not. It is so true, so entirely based upon the facts of human nature, that the question what particular class of persons supplied the author with his examples of folly or misdoing, however interesting to the commentator, may be neglected by the reader. It is also fortunate for him that in three parts out of the four he should have entirely missed "the chief end I propose to myself, to vex the world rather than divert it." The world, which perhaps ought to have been vexed, chose rather to be diverted, and the great satirist literally strains his powers *ut pueris placeat*. Few books have added so much to the innocent mirth of mankind as the first two parts of *Gulliver*, the misanthropy is quite overpowered by the fun. The third part, equally masterly in composition, is less felicitous in invention, and in the fourth Swift has indeed carried out his design of vexing the world at his own cost. Human nature indignantly rejects her portrait in the Yahoo as a gross libel, and the protest is fully warranted. An intelligence from a superior sphere, bound on a voyage to the earth, might actually have obtained a fair idea of average humanity by a preliminary call at Lilliput or Brobdingnag, but not from a visit to the Yahoos. While *Gulliver* is infinitely the most famous and popular of Swift's works, it exhibits no greater powers of mind than many others. The secret of success, here as elsewhere, is the writer's marvellous imperturbability in paradox, his teeming imagination, and his rigid logic. Grant his premises, and all the rest follows, his world may be turned topsy-turvy, but the relative situation of its contents is unchanged. The pains he took to be correct are evinced by the care with which, as Prof. De Morgan has shown, he calculated the proportions of Lilliput and Brobdingnag to ordinary humanity on the basis of 1 to 12 and 12 to 1 respectively, and his copying the description of the storm word for word from Sturmy's *Compleat Mariner*. By such accuracy and consistency he has given the wildest fiction imaginable an air of veracity rivaling Defoe.

Swift's grave humour and power of enforcing momentous truth by ludicrous exaggeration were next displayed in his latter *Modest Proposal for Preventing the Children of Poor People in Ireland from Being a Burden to their Parents, by fattening and eating them* (1729), a parallel to the *Argument*

against *Abolishing Christianity*, and as great a masterpiece of tragic as the latter is of comic irony. The *Directions to Servants* in like manner derive their overpowering comic force from the imperturbable solemnity with which all the misdemeanours that domestics can commit are enjoined upon them as duties. The power of minute observation displayed is most remarkable, as also in *Polite Conversation* (written in 1731, published in 1738), a surprising assemblage of the vulgarities and trivialities current in ordinary talk. As in the *Directions*, the satire, though cutting, is good-natured, and the piece shows more animal spirits than usual in Swift's latter years. It was a last flash of gaiety. The attacks of giddiness and deafness to which he had always been liable increased upon him, and his literary compositions became confined to occasional verses, not seldom indecent and commonly trivial, with the exception of his remarkable lines on his own death and the delightful *Hamilton's Bawn*, and to sallies against the Irish bishops, in whose honest endeavours to raise the general standard of their clergy he could only see arbitrary interference with individuals. He fiercely opposed Archbishop Boulter's plans for the reform of the Irish currency, but admitted that his real objection was sentimental: the coins should be struck as well as circulated in Ireland. His exertions in repressing robbery and mendicancy were strenuous and successful. His popularity remained as great as ever, and, when he was menaced by the bully Bettesworth, Dublin rose as one man to defend him. He governed his cathedral with great strictness and conscientiousness, and for years after Stella's death continued to hold a miniature court at the deanery. But his failings of mind were exacerbated by his bodily infirmities, he grew more and more whimsical and capricious, morbidly suspicious and morbidly parsimonious, old friends were estranged or removed by death, and new friends did not come forward in their place. For many years, nevertheless, he maintained a correspondence with Pope and Bolingbroke, and with Arbuthnot and Gay until their deaths, with such warmth as to prove that an ill opinion of mankind had not made him a misanthrope, and that human affection and sympathy were still very necessary to him. The letters become scarcer and scarcer with the decay of his faculties, at last, in 1740, comes one to his best Dublin friend, Mrs. Whiteway, of heart-rending pathos—

"I have been very miserable all night, and to day extremely deaf and full of pain. I am so stupid and confounded that I cannot express the mortification I am under both of body and mind. All I can say is that I am not in torture, but I daily and hourly expect it. Pray let me know how your health is and your family. I hardly understand one word I write. I am sure my days will be very few, few and miserable they must be. I am, for those few days, yours entirely,—Jonathan Swift.

"If I do not blunder, it is Saturday, July 26, 1740.

"If I live till Monday I shall hope to see you, perhaps for the last time."

Insanity
and
death

In March 1742 it was necessary to appoint guardians of Swift's person and estate. In September of the same year his physical malady reached a crisis, from which he emerged a helpless wreck, with faculties paralysed rather than destroyed. "He never talked nonsense or said a foolish thing." The particulars of his case have been investigated by Dr. Bucknill and Sir William Wilde, who have proved that he suffered from nothing that could be called mental derangement until the "labyrinthine vertigo" from which he had suffered all his life, and which he erroneously attributed to a surfeit of fruit, produced paralysis, "a symptom of which was the not uncommon one of aphasia, or the automatic utterance of words ungoverned by intention. As a consequence of that paralysis, but not before, the brain, already weakened by senile decay, at length gave way, and Swift sank into the dementia which preceded his death" (Crail, *Life of*

Swift). The scene closed on October 19, 1743. With what he himself described as a satiric touch, his fortune was bequeathed to found a hospital for idiots and lunatics. He was interred in his cathedral, in the same coffin as Stella, with the epitaph, written by himself, "Hic depositum est corpus Jonathan Swift, S.T.P., hujus ecclesie cathedralis decani, ubi sœva indignatio ulterius cor lacerare nequit. Abi viator, et imitare, si poteris, strenuum pro virili libertatis vindicem."

The stress which Swift thus laid upon his character as an assertor of liberty has hardly been ratified by posterity, which has comparatively neglected the patriot for the genius and the wit. Not unreasonably, for if half his patriotism sprang from an instinctive hatred of oppression, the other half was disappointed egotism. He utterly lacked the ideal aspiration which the patriot should possess: his hatred of villainy was far more intense than his love of virtue. The same cramping realism clings to him everywhere beyond the domain of politics,—in his religion, in his fancies, in his affections. At the same time, it is the secret of his wonderful concentration of power: he realizes everything with such intensity that he cannot fail to be impressive. Except in his unsuccessful essay in history, he never, after the mistake of his first Pindaric attempts, strays beyond his sphere, never attempts what he is not qualified to do, and never fails to do it. His writings have not one literary fault except their occasional looseness of grammar and their frequent indecency. Within certain limits, his imagination and invention are as active as those of the most creative poets. As a master of humour, irony, and invective he has no superior; his reasoning powers are no less remarkable within their range, but he never gets beyond the range of an advocate. Few men of so much mental force have had so little genius for speculation, and he is constantly dominated by fierce instincts which he mistakes for reasons. As a man the leading note of his character is the same,—strength without elevation. His master passion is imperious pride,—the lust of despotic dominion. He would have his superiority acknowledged, and cared little for the rest. Place and profit were comparatively indifferent to him; he declares that he never received a farthing for any of his works except *Gulliver's Travels*, and that only by Pope's management, and he had so little regard for literary fame that he put his name to only one of his writings. Contemptuous of the opinion of his fellows, he hid his virtues, paraded his faults, affected some failings from which he was really exempt, and, since his munificent charity could not be concealed from the recipients, laboured to spoil it by gratuitous surliness. Judged by some passages of his life he would appear a heartless egotist, and yet he was capable of the sincerest friendship and could never dispense with human sympathy. Thus an object of pity as well as awe, he is the most tragic figure in our literature,—the only man of his age who could be conceived as affording a groundwork for one of the creations of Shakespeare. "To think of him," says Thackeray, "is like thinking of the ruin of a great empire." Nothing finer or truer could be said.

Swift's correspondence is the best authority for his life. Of his contemporaries, we are mainly indebted to his panegyrist Delany and his detractor Lord Orrery. Hawkesworth compiled the particulars of his life, and published what was the standard edition of his works till the appearance of Sir Walter Scott's in 1814. This edition is not likely to be superseded, but might with great advantage be reissued with amendments and additions. The biography prefixed is based on Hawkesworth, but is far more copiously and elegantly written. At the same time the authors' views are frequently conventional, his judgments superficial, and his good nature has made him too indulgent to his hero. The late John Forster subjected all available records of Swift's life to the most diligent scrutiny, and in 1875 published the first volume, coming down to 1711, of a biography intended to have been completed

in three volumes. Invaluable in many respects, it exhibited the process as well as the result of biography, and hence threatened to be too long. Mr H Craik, succeeding to the post vacated by Forster's death, judiciously reduced the scale, and produced in one volume (1882) a work which will long rank as the standard one on the subject. Remarkable monographs on Swift have been produced by Leslie Stephen in the "Men of Letters" series, Dr Johnson in the *Lives of the Poets*, Thackeray in the *English Humourists*. Mr Stephen is anxiously impartial, Johnson's acuteness is perverted by his antipathy, Thackeray, as is natural in a novelist, has dwelt disproportionately on the romantic side of Swift's history, and his pity for Stella and Vanessa forms too large an element in his general judgment. But he has, better than any one else, apprehended the fearfully tragic element in Swift's character and fortunes. Swift's early life has been carefully investigated by Dr Barrett of Trinity College, and the final epoch of his life by Monck Mason and Sir William Wilde. His greatness is exaggerated and his failings are extenuated in two brilliant articles in the *Quarterly Review*, vols. cli and clvi. Minor points in his life and writings have received much elucidation from numerous inquirers, especially the late Mr Charles Dilke and Colonel F Grant. Mr Stanley Lane Poole has edited selections from his works and correspondence, with excellent notes and prefaces, and has prepared a valuable bibliography. (R G.)

SWIMMING AND DIVING In the case of man the power of swimming is acquired, not natural. As compared with the lower animals, to most of which it comes perfectly easily, he is at a disadvantage in its acquisition, owing not to his greater relative weight so much as to the position of his centre of gravity, along with the fact that in the case of quadrupeds the motions which serve to support and propel them in the water are very similar to those of locomotion on land. No race of mankind, however, can be mentioned to which the art is unknown, and in many barbarous countries it is more widely diffused and carried to greater perfection than amongst the civilized nations of the world.

For learning to swim, a quiet sandy beach is the best place, as sea water is more buoyant than fresh. All artificial aids, such as corks, air belts, cork jackets, inflated bladders, and the like, may be avoided, they raise some parts of the body too high above and so sink others too far below the natural plane of flotation, whereas the first fundamental rule is that the mouth only should be above water, and the legs close to the surface. Belts, &c., are also apt to become misplaced and so cause trouble and annoyance as well as danger. It is best for beginners to take some instruction from a practical teacher, though many have become adepts by merely watching good performers. Confidence in the floating power of the body is the first thing to be acquired. The easiest way of floating is to lie on the back (which should be slightly hollowed), the arms being stretched out beyond the head but not lifted out of the water, this attitude not only facilitates respiration but counterbalances the weight of the lower limbs. The knees may be bent outward, the toes also pointing sideways, the hips rigid, so assisting to keep the legs up as close as possible to the top of the water. By easy breathing one will soon be convinced that, properly balanced and with lungs kept charged, the body will assert its buoyancy.

To further enable him to realize that water is capable of supporting the human body, the learner may adopt the following plan. Walk down the steps of a bath, or along a shelving beach on a calm day, into about 3 feet of water, turn and face the shallow place, and, having taken a breath, stoop down and try to pick an egg or some similar object (a handful of sand will suffice) from the bottom. Repeat this several times leisurely, going farther out at each venture, till the water reaches up to but not higher than the middle of the chest. It will soon be found that the object is not so easy of recovery, and the beginner learns that but little exertion is required to keep the body afloat. When this experience has been gained the novice should commence with the *Breast Stroke*, which is nowadays some-

times unjustly set aside as the "old stroke." It is neat, natural, and graceful enough, though necessarily the slowest, from the great resistance of the chest to the water and the fact that part of the arm stroke is negatived by its own movement. Like walking in pedestrianism, however, it forms the groundwork of every other branch of the art, and cannot safely be overlooked. The stroke is commenced by placing the hands with the backs upward, and the wrists bent so that the fingers will point to the front, the insides of the wrist-joints between arm and thumbs touching the breast not lower than 4 inches under water. Begin the stroke by pushing the arms gently forward to their full extent, keeping the palms flat and the fingers closed. Now turn the palms of both hands outward, and make a strong stroke to the right and left by each arm through an angle of 90°, in this part of the stroke the two arms describe a semicircle, of which the head may be termed the centre. It must be most distinctly borne in mind that all depression of the hands will tend to raise the body perpendicularly, whereas the only true position in swimming is the horizontal, which propels it forward. To complete the arm movement, bend the elbows backward and inward, until they come close to (but not necessarily touching) the sides of the body. Carry the hands in a straight line edgewise to the position from which they started in front of the chest. Simultaneously with the stretching of the hands from the front of the body the feet are struck out to the utmost width in a way cleft for them by the toes. As the arms are being brought round in the semicircular motion the lower limbs are stiffened and brought firmly together by grasping the water, so to speak, with the whole of the leg, more especially between the knees, ankles, and soles and toes of the feet. Whilst thus imparting forward motion to the swimmer, they finish in a straight line behind the body. Then, when the arms are bent, and the hands are being brought to the front of the body, the knees are turned outward, heels kept together, toes also turned out, and the feet are carried up to the body and in this position are once more ready for repeating the movements as described. Beginners must be careful not to make the arm movements quicker than those of the legs, and it must be distinctly remembered that the latter are the great propellers. Unison of the movements as mentioned, and regularity in each part of the stroke, are indispensable to perfection. All hurry and excitement must be carefully avoided, and every complete stroke and kick gone about with mechanical precision and neatness. The only part requiring strong muscular exertion being the closing of the legs after they have been spread wide apart,—the one strong propelling element,—every effort is to be made to ensure correctness and power in its performance. The arm movements should be easy and graceful, all jerkiness or suddenness of motion being carefully avoided.

Breathing should be unrestrained and natural, without gasping, sputtering, or short or sudden heavings. A safe rule is to have a full breath at every stroke, its division being regulated as follows. Blow slowly outward when the first part of the arm movement is being performed, i.e., stretched out in front, inspire as the hands are going outward and round. Then, as the lungs are fully charged, no effort is necessary to suspend respiration while the hands are carried in to the front of the body again. This regularity of breathing is essential to pleasure, comfort, and gracefulness of action. The nostrils and air-passages should always be thoroughly cleared, the mouth cleansed, and the throat gargled before entering the water.

Swimming on the Back is a pleasant and useful branch of the art, the chief requisite for its acquirement is confidence. The tyro should begin practice in water reaching

up to about the upper part of the chest, turn his back shoreward, take a long breath, and lie gently backward in the water, keeping the hands on the waist with the elbows extended outward, the chest being expanded, and the breath held. As one lies well back the feet will be lifted off the ground, they should then be spread outward as far apart as possible, in the same position as when they are opened up in breast swimming. The body and legs are thus lying extended at full length like the letter Y, the legs forming the branches or foik. Now comes the propelling part of the movement. As in the front stroke, the muscles are set, and the legs are by one strong motion brought firmly and closely together. While this is being done the toes, by a slight movement of the ankle, are turned upward, and so, as the movement is finished, the great toes, inner ankles, and inside of the whole leg meet. This motion, strongly but not jerkily executed, sends the body forward, and, when the impetus obtained is nearly—not quite—expended, the legs are bent, so that the feet are drawn close up to the trunk, with the knees outward and heels together. The stroke is renewed by spreading apart, closing again, and so on. The breath is exhaled when spreading and closing the legs, and inhaled as the feet are drawn up to the body. If greater speed is wanted, the hands can be used as sculls by carrying them outward from the body, but at the same time level with it, palms facing downward. When the arms are sufficiently extended to be in a line across from hand to hand, the wrists are turned to allow of the palms of the hands facing toward the feet, thumbs upward. Elbows, wrists, and hands are now firmly braced, and a strong pull towards the legs is made. This is the progressive motion, and should be performed just as the legs are being closed.

Another style is to bend the elbows downward, so as to allow of the hands being carried upward along the sides of the body, thumbs inward, and palms facing the bottom of the water. When the hands have been carried up to the armpits they are spread apart to the full extent of the arms, and the propelling part is performed as in the other method by pulling strongly toward the legs.

A still more powerful stroke, and one used at competitions, is accomplished by carrying the hands up to the armpits, as described in last method, then, turning the wrist so as to allow of the palms of the hands facing upward, point the fingers in the direction of progress, stretch both arms as far as possible in a line with the body and beyond the head, and turn the wrists half round, until the hands are back to back, thumbs upward. The propelling action is now performed by sweeping both hands outward and round until they touch the legs and the arms are once more straight along the sides of the body. There is a double kick in this style, and the action is as follows. When the hands are being carried up to the shoulder one kick is delivered, then as the arms are being carried beyond the head the nether limbs are drawn up in position for another kick, which is delivered as the arms are sweeping down on the stroke. This is no mere ornamental stroke, but combines in its practice grace with power, and enables the swimmer to move through the water at great speed.

Another racing back stroke is performed by lifting hands and arms out of the water at the finish of the pull downward, carrying them in the air, stretching them at full length forward beyond the head, and then dipping them into the water, executing the positive part of the stroke as in the last-described method. In this stroke there is only a single kick to each pull of the arms, the legs being drawn up as the arms are swung up in the air and closed as the arms are pulled through the water. While this movement is much practised by some experts, it is neither so graceful nor so speedy as the other, and

there is much splashing, while steering is, in the case of a close race, likely to become rather erratic. Both are at the present time the fastest known methods of swimming on the back, and, with moderately good turning and pushing in a swimming bath, 100 yards should be covered in about 74 seconds, probably less.

Of *treading* as a branch of swimming something should be known by every one. It is the only department of the art that is at all unnatural, and, if treading were resorted to in cases of accidental immersion, three-fourths of the resulting deaths would be prevented. The essential condition, of course, is that the hands be kept under water. When one falls into water the legs sink and the body assumes a perpendicular position, the water splashes over the face, and, once the eyes become filled or the mouth covered, the inclination of any one unable to swim is to throw the hands up and make an effort as if to creep along on the surface. These efforts only increase the danger of the position. On becoming submerged one should keep perfectly inactive for a brief time, the head will soon rise above the surface, and at this moment one ought to beat downward with both hands alternately, never allowing them to splash or disturb the surface, the head being leaned back so as to keep only the face and nostrils clear. The back of the head and ears may be covered, but this does not matter. The motions of the hands, exactly similar to those of a dog's forepaws when swimming and walking, are to be continued, the feet at the same time striking down—not hurriedly, nor with sudden jerky movement, but easily and gracefully, the ankles moving as if working treadles, so that the soles of the feet act as sustaining and, it may be, propelling surfaces. The movements of hands and feet may be altered by beating downward with both hands at once, or both feet at once, but in cases of accident the former action is to be recommended. Swimmers, when treading at competitions or for display, either fold their arms across their chest or hold hands and arms above the surface. In artistic swimming trials, as much as possible of the body should be shown above the surface, and bobbing up and down ought to be avoided. Treading is of much importance even to a good swimmer, as it allows him to divest himself of upper clothing, and enables him to lay hold of anything, such as a rope or line that does not quite reach the surface, it is also the most comfortable position in which one can partake of refreshment in case of a long swim, and is useful for purposes of conversation.

The *Side Stroke* may be said to hold in swimming a position somewhat similar to that of running in pedestrianism, as it becomes better known, the advantages of this style of aquatic progression are becoming more and more appreciated. The practice of it, however, ought not to be begun until complete proficiency has been attained in the primary stroke. Its main recommendations are apparent almost at a glance. A good average side movement will carry the swimmer a stroke in two seconds, each stroke covering a distance of fully six feet. The method is said by some to have been introduced by George Penters about the year 1850. The body is turned on either side, but preferably with the right side downward, as thereby the legs act more freely and naturally and the heart has no weight on it to impede its action. The head is more immersed and thereby reduced in weight, being supported by the water and not by any muscular exertion of the neck or shoulder, and the lower extremities are less immersed than in the breast stroke. If one is lying on the right side, the right arm is thrown boldly out in front, with the palm of the hand downward and on a level with the lower side of the head. When pushed out to the utmost it is kept rigid, brought downward through the water in one strong movement, without any bending of either wrist or elbow,

and this, the positive action, is finished when the hand has reached the legs, and comes between these limbs at full stretch. It is then carried up along the body to the chin, and the stroke renewed. The left hand is formed into a scoop, turned outward by the wrist at right angles to the fore arm. The left arm, with the elbow bent, is then directed outward, and makes a straight pulling (not circular nor swinging) stroke to the left hip. When one arm is performing the negative the other is at the positive part of the stroke. The action of the legs should be long and vigorous, and they should never cross each other, but should work in unison with the arms and shoulders. The left knee is brought up in front of the body, with the foot in front of and at right angles to the body. Put the foot in a line with the front of the leg, and bring it round to meet the other in a line with the body. Meanwhile stretch the right or lower leg as far away as possible from the body toward the back and then bring it down to meet the other by a powerful plain stroke. The legs are then returned upward to the body, the heels touching, the knees apart, the toes of the left foot forward and of the right foot downward. To learn this graceful and useful side stroke some persons need long and steady practice, others acquire it comparatively quickly. The swimmer steers with his left or right hand and arm as the direction demands. The head and neck must be held in one position, not raised nor turned at any part of the stroke. Bearings should be taken from what can be seen in the line of vision away from and in front of the body, and only very seldom indeed should the head be turned to look in advance. Breath is inhaled as the under hand is pulling downward, and exhalation should take place while the mouth is immersed, which is when the uppermost hand is performing the stroke along the body.

The coincident movement of arms and legs may be thus described. As the legs are bent up to the body the upper or left hand has been stretched in front and the right or lower arm has just finished the pull. As the top arm pulls downward the legs are opened wide and almost in the same motion swung round and closed. It will be apparent that the legs are returned upward with knees bent as the downward pull is being performed with the lower arm. No effort is to be made to sink the head, neither is it to be held up in any way. The turn of the body by the power of the strokes will be quite enough to allow of the lips being sufficiently clear of the water for the purpose of inspiration. There should be no sudden pull at any part whatever of this complete stroke.

The *Overhand Stroke*, when properly practised and acquired, is the most useful and easy of all styles of swimming. Beginners, however, should beware of acquiring it before they are thorough adepts with the side stroke, otherwise they lose all power of speed and good appearance. Harry Gurr is sometimes said to have been the inventor of this stroke in 1863, but Harry Gardener, in August of the year previous, when he won the 500 yards championship in Manchester, used the overhand or over-arm stroke. The only movements of the side stroke which differ from those of the overhand are those of the left or upper arm and hand. By carrying this arm in the air a lengthened reach is obtained above the surface. As in the side stroke, the head lies as far as possible into the water, the body, legs, and feet in a straight line level with and close to the surface. The left arm is carried forward and stretched as far as possible out of the water in a line with the face and in advance of the head. The arm and hand re-enter the water, and are pulled through it with the strongest propelling stroke. The limb out of water should be carried through the air quietly, gracefully, and evenly till dipped for the stroke, not swung uselessly

round from the shoulder in a half circle. The left arm and hand being in the air, the head lies deeper in the water than in the side stroke, and it is reduced in weight. The legs work simultaneously with the left arm, that is, they are drawn up as this arm reaches in front, and are at their nearest wide stretch by the time it is in position for the pull, they are then pulled strongly together as the upper arm is performing its strong movement. At no time when the upper arm is being carried forward above the water should the hand be higher than a very few (say about three) inches above the surface. The elbow alone is elevated, and is the highest part of the arm. In fact, the hand is so close to the surface that, on being lifted upward after the delivery of the stroke, the wrist has to be bent, otherwise the fingers would actually touch the water. Once, however the hand comes opposite the eyes it is straightened in a line with the fore arm and in this position carried to the dipping point. Breathing is regulated in precisely the same way as when swimming by means of the side stroke.

Touching and Turning.—The methods of "touch and turn" were brought into vogue by the now numerous swimming races in baths. Whether the baths be long or short, from 10 to 15 feet in the push off is gained at each end of every length by all competitors. Assuming that the swimmer is moving the side or over-hand stroke and going on the right side, the method to be adopted is as follows. When within 3 feet of the end wall of the bath the left or upper hand quits its propelling movement, and reaches in front of the head till it touches the wall just above water mark. The palm of the hand is then placed horizontally on the wall, the fingers to the right, which is the direction to which one is turning, the little finger is uppermost and thumb undermost. The knees are bent, and the body, now close to the wall is turned to the right on its own axis by the left hand, after which the feet press against the wall under the hand. As in diving and plunging, the body, arms, and hands are in a straight line, and the hand between the biceps, all under water. The thighs are doubled up under the loins, the calves of the legs touching the back of the thighs, and the soles of the feet pressing hard against the wall. A strong push off is made by the feet and legs and the swimmer resumes his ordinary stroke and course for a new length.

Ocean Swimming.—Persons having from any cause to swim in the heavy rolling breakers of mid ocean should use the side stroke when available. No attempt should be made to breast or mount the waves. By taking their direction a side-stroke swimmer is carried an unexpectedly long distance. The large dangerous rollers come almost in regular succession after an interval of small waves. The swimmer soon notices them, fills his lungs, swims into them, ducking the head, and quickly emerges when the wave has passed. Then a fresh supply of breath is inhaled.

Plunging.—In this the performer enters the water in somewhat the same manner as when diving (see below), but at a flat angle, and from the moment of doing so makes no active muscular movement whatever of any part of the body under water. Plunging came into vogue as the most graceful and practical method of starting in swimming races. From 3 to 5 feet above the water level makes the best springing point, whether from bank, board, or rock. The knees should be kept together and slightly bent, with the weight on the balls of the feet and the lungs fully charged. The spring forward at the signal to start is given with all muscular power available. A swing of the arms from behind is taken, and, as the feet quit their support, the arms are swung forward so as to rise up to and straight beyond the head. The body is shot into mid air as far as possible, and, before touching the water, the head falls between the arms till the chin just touches the chest and the ear grazes the inside of the biceps. The body now glides gracefully and almost noiselessly into the water, with the chest slightly hollowed, the shoulders contracted, and the arms rigidly forced out straight. The hands are now laid flat and the thumbs locked while the hips and ankles are kept in one rigid straight line, with the soles of the feet turned upward and level with the surface, the toes pointing straight behind. The forward motion from the spring continues as long as the body will float and the air in the lungs can be held, when the feet, followed by the arms, begin to sink, and the plunger ends his performance by merely raising his head. Adepts in this branch have saved themselves from a sinking vessel by a long plunge from the ship's side, and so by one effort have got clear out of the vortex that is caused by her settling down and sinking.

Diving.—The rule in diving, as distinguished from plunging, is most explicit. In diving alone are the limbs allowed to make muscular movements under water. When properly performed it is a most graceful feat to the eye, and a good swimmer is, as a rule,

will suffer and the stay under water will be shortened.

Plate Swimming—This is a most interesting and enjoyable branch of the art. From a very early period we find references to mechanical appliances as aids to progression and support in the water, these helps generally taking the form of large flat surfaces made of wood, tin, leather, waterproof fabrics, or other similar materials. Sometimes they were flat, in other instances slightly concave. Some were made brided like the covers of a book, or hinged, others opened and closed with umbrella like action, while quite a large number were made web like, to resemble a duck's foot, nearly all were more or less collapsible. From what can be gleaned of the style of these articles it is evident that the inventors cannot have been familiar with the principles of swimming, or aquatic propulsive action, and so, while a number of the contrivances were undoubtedly the outcome of much thought and ingenuity, they could not be regarded as in any way improving on the ordinary or primitive swimming movements, and, while greater surface than is offered by hands and feet was always given, with the evident intention of reducing "slip," much resistance took place at the neutral or negative part of the stroke. The one good effect in most of these inventions was thus more than nullified by this "drag," which, besides being objectionable in itself, had the additional disadvantage of bringing into requisition muscles of legs and arms the development of which was antagonistic to perfection of swimming. In 1876 Mr R. H. Wallace Dunlop, C.B., announced that he had invented swimming plates which afforded increased speed without causing undue straining of the muscles, and these claims have been justified by subsequent experience. The arrangements for a lateral movement of the heels in the footboards or plates, with freedom of the ankles, showed at once that Mr Dunlop had fully studied the details of the art of swimming, with the effect of greatly reducing "slip" in the positive and altogether doing away with "drag" in the negative parts of the leg stroke. Slow swimmers, by the use of the new appliances, move quickly and easily through the water, whilst moderately fast swimmers have their speed increased to an almost wonderful extent. To swim 100 yards in 70 seconds without artificial aid is regarded as a good per-

Long Immersions.—It is on record that on October 6, 1851, Samuel Brock, a Yarmouth fisherman, after being capsized, remained in the water for 7½ hours before he was picked up. As a long distance swimmer in ocean and tidal waters no one has ever approached Matthew Webb (1848–83), of the British mercantile marine service. His first great feat was plunging (April 23, 1873) off the Channel S S “Russia” into a heavy sea in the unsuccessful endeavour to save a young sailor who had fallen overboard, when he passed 37 minutes in the sea before the lifeboat relieved him. He received the silver medal from the Royal Humane Society of London, the Stanhope gold medal, and a £100 purse subscribed by the passengers of the “Russia.” In June 1874 he swam from Dover to the north east Varne buoy (9¼ sea miles). On July 3, 1875, he went from Blackwall Pier to Gravesend Town Pier on an ebb tide (18½ miles) in 4 h 42 m 44 s., and on July 19, 1875, from Dover to Ramsgate (15 sea miles) in 3½ h. An unsuccessful attempt to swim from Dover to Calais (17¼ sea miles) in the narrowest part of Dover Straits took place on August 12, 1875. He afterwards successfully accomplished the feat on August 24–25, 1875, after 21 h 44 m 55 s immersion, the distance swum having been as nearly as possible 39½ statute miles. A foolhardy attempt to swim the whirlpool rapids of Niagara cost Webb his life on July 24, 1883. On September 15, 1875, F. Cavil swam on the ebb of a strong spring tide from Putney to Blackwall (13 miles 3 furlongs) in 3 hr 50 m. Miss Agnes Beckwith, of London, on the 17th July 1878, swam 20 miles in the Thames, without any assistance whatever, in 6 hours 25 minutes. Horace Davenport, of London, for years amateur champion of Great Britain, on 21 September 1884, swam from Southsea, Portsmouth, to Ryde, Isle of Wight, and back again in 5 h 25 m.

Remarkable and Best Swimming Records.—The great majority of these have been achieved in England, but accurate statistics cannot be said to be plentiful. The following are some of the authentically recorded results.

[illegible]

yards 21 m. 100 yards 1 m. 74 s. 120 yards 1 m. 28 s. 110 yards 2 m. 2 s. 20 yards 2 m. 41 s. 220 yards 2 m. 54 s. 400 yards 2 m. 44 s. 1 mile 6 m. 21 s. 1 mile 7 m. 14 s. 600 yards 2 m. 41 s. 800 yards 11 m. 40 s. 1 mile (21 turns) 13 m. 3 s. 1000 yards 14 m. 53 s. 1200 yards, 15 m. 4 s. 3 mile 20 m. 3 s. 100 yards 21 m. 17 s. 1 mile (43 turns), 27 m. 21 s. The records of other clubs include—100 yards 6 m. 5 s. (Oldham Baths) 100 yards 1 m. 4 s. (Blackburn Baths) 1 mile 2 m. 21 s. (Westminster Aquarium) (all times.)

Longest Time and Water in Glass Tank—4 m. 29 s.

Longest Dives—109 yards 2 feet 6 inches and 117 yards 1 foot

Longest Plunge—From a springboard 5 feet above the level surface of the water 73 feet 1 inch from a fixed board, 5 feet 6 inches above the water level 6 feet 1 inch

For baths and bathing see BATHS vol. III p. 434. For drowning and resuscitating life see DROWNING vol. VII p. 47. There are two societies with headquarters in London which consist of delegates from nearly all the swimming clubs in the metropolis. They have framed rules and regulations for the conduct of club races and their performances included under "swimming." The Professional Swimming Association was successfully floated by Mr. Robert Wain on July 6, 1881. The Amateur Swimming Association was re-inaugurated in 1886 by the amalgamation of the Swimming Association of Great Britain and the Amateur Swimming Union. There are annual competitions for the amateur champion ships at 100 yards, 1 mile, 1 mile in still water, and 3 miles in the Thames. There are also the Associated Swimming Clubs of Glasgow and the Associated Clubs of Dundee, each similar in its objects and composition to the Amateur Swimming Association.

The literature of the subject of swimming is considerable, and the following works may be mentioned. Thereout *The Art of Swimming* translated from the French London 1789. *Swimming* two letters by Benjamin Franklin, Bangay 1791. Walker's *Amateur Sports* art. "Swimming" London 1836. G. H. Chas. *Gymnastics and Swimming* London 1840. W. H. Lateral, *Swimming and Summers* London 1861. S. W. Higginson, *Swimming* in *The American and Continental Monthly* May 1870. *Piscator* Nov. to Dec. London 1872. Charles S. Sedman, *Manual of Swimming* London 1873. Leach, *Swimming in the Elton Style* Nottingham 1875. J. Bell Pettigrew, *Animal Locomotion* London 1874. W. Wilson, *Swimming Diving and How to Save Life* Glasgow 1876. Torkington, *Swimming Drill* London 1876. P. H. W. Dunlop, *Plate Swimming* London 1877. *Ministry of Education* *Manual of Swimming* New York 1878. W. Wilson, *The Swimming Instructor* 1883. J. H. Walsh art. "Swimming" *British Pictorial Sports* London, 1886. (H. F. W.—W. W. I.)

SWINDON The towns of Old and New Swindon, in Wiltshire, England, are situated on several railway lines, about 77 miles west of London and 30 east north-east of Bath. The old town is built on an eminence commanding fine views of the surrounding country. It received a charter for a fair from Charles I., and has weekly markets for corn and cattle. The church was erected in 1851, from the designs of Sir Gilbert Scott. There is a town-hall and a corn exchange. Swindon New Town, to the north from Old Swindon, has grown up since the construction of the Great Western Railway, which has its principal works there. There is a market-house for meat, fish, and vegetables. Connected with the Great Western Railway mechanics' institution there is a library of about 14,000 volumes. The combined areas of Old and New Swindon, which form separate urban sanitary districts, amount to 2524 acres, with a population in 1881 of 22,374. Old Swindon (area 1214 acres) had a population in 1871 of 4092 and in 1881 of 4696, and New Swindon (area 1310 acres) a population in 1881 of 17,678.

SWINE The oldest known even-toed or Artiodactyle Ungulates (see MAMMALIA, vol. xv p. 429) were neither Oxen, Antelopes, Deer, Camels, nor Pigs, but presented a generalized type, which by modification in various directions has given rise to all these very diverse forms. They were mostly of small size, and had invariably the full number of teeth of the typical mammalian heterodont dentition, viz., 44, of which the incisors were $\frac{3}{2}$ on each side, the canines $\frac{1}{2}$, the premolars $\frac{4}{2}$, and the true molars $\frac{3}{2}$. The molars were short and square, crowned with blunt, rounded cusps, and the canines were not remarkably developed. All the feet terminated in four toes, the two middle ones (the third and fourth of the complete typical mammalian extremity) of nearly equal size, the outer ones (second and fifth) smaller, and also equal. The five-toed ancestor of these forms has not yet been discovered. They had no special weapons, as horns or antlers, on their foreheads. Such was the condition of all the hitherto discovered animals of this division at the commencement of the Tertiary period. Very early a change took place in the characters of the molar teeth in certain members of the group: the rounded tubercles became sharp ridges curved in a crescentic form, and better adapted for a purely herbivorous diet, especially for cutting and bruising the comparatively dry and hard blades of grass which grow

in open plains. The animals thus separated from the rest—the Selenodont (crescent-toothed) Artiodactyles—have undergone various further modifications of teeth, feet, and other parts, and constitute the diverse forms of ruminating animals mentioned above. Those whose molar teeth retained more of the primitive tuberculated (bunodont) form, were the ancestors of the present family of Swine, some of which, looking upon their organization as a whole, have undergone less change since the Eocene period than almost any other mammals.

Remains of very generalized swine-like animals have been abundantly found in Eocene and early Miocene formations both in America and Europe. In the former continent they never (as far as present evidence indicates) underwent any great diversity of modification, but gradually dwindled away and almost died out, being only represented in the actual fauna by the two closely allied species of peccary, among the smallest and most insignificant members of the group, which have existed almost unchanged since the Miocene age at least, if the evidence of teeth alone can be trusted. In the Old World, on the other hand, the swine have played a more important part in recent times, having become widely distributed, and throwing off some curiously specialized forms. At the present time, though not very numerous in species, they range through the greater part of the Old World except within or near the Arctic Circle although, in common with all the other members of the great Ungulate order, they were completely absent from the whole of the Australian region until introduced by man in very recent times.

The existing swine-like animals may be divided naturally into three families—I *Hippopotamidae*, II *Suidæ*, or true Pigs, III *Dicotylidae*, or Peccaries.

I FAMILY HIPPOPOTAMIDÆ.

Muzzle very broad and rounded. Feet short and broad, with four subequal toes, with short rounded hoofs, all reaching the ground in walking. Incisors not rooted but continuously growing, those of the upper jaw curved and directed downwards, those of the lower straight and procumbent. Canines very large, curved, continuously growing, upper ones directed downwards. Premolars $\frac{1}{2}$, molars $\frac{3}{2}$. Stomach complex. No cæcum.

This appears to be an exclusively Old-World form,—no animals belonging to it, either recent or fossil, having been found in America. The family has been divided into three genera, according to the number of the incisor teeth: (1) *Hexaprotodon*, incisors $\frac{3}{2}$, a type which comes nearest to the generalized or ancestral form of the group, is now extinct, being only known from the early Pliocene formations of the Sub-Himalayan range. (2) *Hippopotamus* proper, incisors $\frac{2}{2}$, contains the one well-known species *H. amphibius*, now confined to the rivers and lakes of Africa, but formerly (in the Pliocene period) abundantly distributed, under various minor modifications, in Europe, as far north as England. Remains of an allied form have been found in the island of Madagascar, where it is now extinct. (3) *Cheropsis*, incisors reduced to $\frac{1}{2}$, contains one very small and still little known species, from rivers of Liberia, West Africa, *C. hibernensis*. See HIPPOPOTAMUS.

II. FAMILY SUIDÆ.

An elongated mobile snout, with an expanded, truncated, nearly naked, flat, oval terminal surface in which the nostrils are placed. Feet narrow, four completely developed toes on each. Hoofs of the two middle toes with their contiguous surfaces flattened. The outer (second and fifth) digits not reaching to the ground in the ordinary walking position. Teeth variable in number, owing to the suppression in some forms of an upper incisor and one or more premolars.

Incisors rooted Upper canines curving more or less outwards or upwards. Stomach simple, except for a more or less developed pouch near the cardiac orifice. A cecum. Colon spirally coiled. Connected to the Old World.

Sus.—Dentition $i \frac{3}{3}$, $c \frac{1}{1}$, $p \frac{4}{4}$, $m \frac{2}{2}$, total 44. Upper incisors diminishing rapidly in size from the first to the third. Lower incisors long, narrow, closely approximated, and almost horizontal in position, their apices inclining towards the middle line, the second slightly larger than the first, the third much smaller.

FIG 1.—Dentition of Boar (*Sus scrofa*)

Canines strongly developed and with persistent roots and partial enamel covering, those of the upper jaw not having the usual downward direction, but curving strongly outwards, upwards, and finally inwards, while those of the lower jaw are directed upwards and outwards with a gentle backward curve, their hinder edges working and wearing against the front edges of the upper canines.¹ They appear externally to the mouth as tusks, the form of the upper lip being modified to allow of their protrusion, but are much less developed in the females than in the males. The teeth of the molar series gradually increase in size and complexity from first to last, and are arranged in contiguous series, except that the first lower premolar is separated by an interval from the second. First and second upper premolars with compressed crowns and two roots. The third and fourth have an inner lobe developed on the crown, and an additional pair of roots. The first and second true molars have quadrate crowns, with four principal obtuse conical cusps, around which numerous accessory cusps are clustered. The crown of the third molar is nearly as long (antero-posteriorly) as those of the first and second together, having, in addition to the four principal lobes, a large posterior talon or heel, composed of numerous clustered conical cusps, and supported by several additional roots. The lower molar teeth resemble generally those of the upper jaw, but are narrower. Milk dentition $i \frac{3}{3}$, $c \frac{1}{1}$, $m \frac{3}{3}$, total 28,—the first permanent premolar having no predecessor in this series. The third incisor, in both upper and lower jaw, is large, developed before the others, and has much the size, form, and direction of the canine. Vertebrae C 7, D 13–14, L 6, S 4, C 20–24. The hairy covering of the body varies much under different conditions of climate, but when best developed, as in the European wild boar, consists of long stiff bristles, mostly abundant on the back and sides, and of a close softer curling under-coat.

¹ If from any accidental circumstances these teeth are not constantly worn down by friction, they grow into a complete circle, the point penetrating the bone of the jaw close to the root of the tooth. The natives of the Fiji Islands avail themselves of this circumstance to produce one of their most valued ornaments—a circular boar's tusk. The upper canines being extracted, the lower ones are allowed to grow to the desired form.

This genus occurs at present under three principal modifications or subgenera.

A *Sus* proper comprises a number of animals found in a wild state throughout the greater part of Europe (except where exterminated by human agency), the north of Africa, southern continental Asia, and the great islands of the Malayan archipelago, Formosa, and Japan. The following among others have been admitted by zoologists as distinct species—*Sus scrofa*, the wild boar of Europe, Asia Minor, and North Africa, once common throughout the British Isles; *S. scunniensis*, North-East Africa; *S. cristatus*, Hindustan; *S. vittatus*, Java, Borneo, Amboyna, Batehian; *S. barbatus*, Borneo; *S. papuensis*, New Guinea; *S. timorensis*, Timor and Rotti; *S. andamanensis*, Andaman Islands; *S. celebensis*, Celebes; *S. tananarivensis*, Formosa; *S. leucomystax*, Japan; *S. leucomystax*, Java, Borneo, Ceram. This list will give some idea of the geographical distribution of wild pigs, but it must be borne in mind that through the whole of this region, and in fact now throughout the greater part of the habitable world, pigs are kept by man in a domesticated state and it is still an open question whether some of the wild pigs of the islands named above may not be local races derived originally from imported domestic specimens. In New Zealand a wild or rather "feral" race is already established, the origin of which is of course quite recent, as it is well ascertained that no animal of the kind ever lived upon the island until after its settlement by Europeans. Whether the various breeds of domestic pigs have been derived from one or several sources is still unknown. As in so many similar cases there is no historic evidence upon the subject, and the researches of naturalists, as Nathusius, Rüttimeyer, Rolleston, and others, who have endeavoured to settle the question on anatomical evidence, have not led to satisfactory conclusions. It is, however, tolerably certain that all the species or forms of wild pigs enumerated above and all the domestic races are closely allied, and it is probable (though of this there has been no opportunity of proof)

FIG 2.—Wild Boar and Young

will breed freely together. It is a curious circumstance that the young of all the wild kinds of pigs (as far as is known at present) present a uniform coloration, being dark brown with longitudinal stripes of a paler colour, a character which completely disappears after the first few months. On the other hand, this peculiar marking is rarely seen in domestic pigs in any part of the world, although it has been occasionally observed. It is stated by Darwin that the pigs which have run wild in Jamaica

reaches its most complete reduction, as in adult specimens the upper incisors are absent and the lower ones worn down to the roots

III. FAMILIA DICOTYLIDÆ.

Snout as in Snide. Dentition $1\frac{2}{3}, c\frac{1}{3}, p\frac{3}{3}, m\frac{3}{3}$, total 38. *Incisors rooted upper canines directed downwards, with sharp cutting hinder edges. Toes, four on the fore feet and three on the hind feet (the fifth wanting). Stomach complex. A cæcum. Conjoined to the New World.*

There is one genus, *Dicotyles*, with two species, *D. taqaqn*, the Collared Peccary, and *D. labiatus*, the White-lipped Peccary. See PICCARY. (W H F)

SWINEMUNDE, a Baltic port and bathing-place on the island of Usedom in Pomerania, Prussia, is situated at the mouth of the Swine, 35 miles to the north west of Stettin. Its broad unpaved streets and one story houses built in the Dutch style give it an almost rustic appearance, although its industries, beyond some fishing, are entirely connected with its shipping. The entrance to the harbour, one of the best on the Prussian Baltic coast, is protected by two long breakwaters, and is strongly fortified. Swinemunde lighthouse, 216 feet high, the loftiest in Germany, rises beside the new docks on the island of Wollin, on the other side of the narrow Swine. Ships drawing not more than 16 feet can proceed to Stettin, but those of heavier burden discharge or lighten at Swinemunde, which thus stands in the relation of a fore-port to the larger city, with which it is connected by railway. Exclusive of merely passing ships, 615 vessels with a burden of 189,191 tons entered and 607 vessels with a burden of 179,336 tons cleared the port in 1880. In 1882 it possessed a fleet of 39 vessels with a burden of 5218 tons. The population in 1880 was 8478.

The Swine, the central and shortest passage between the Stettiner Haff and the Baltic Sea, was formerly flanked by the fishing villages of West and East Swine. Towards the beginning of last century it was made navigable for large ships, and Swinemunde, which was founded on the site of West Swine in 1748, was fortified and raised to the dignity of a town by Frederick the Great in 1766. In 1775 it had 1000 inhabitants, in 1816 3191.

SWINTON, a town in the West Riding of Yorkshire, is situated at the junction of the Dearne and Dove navigation with the river Don navigation, and of the South Yorkshire and Midland railway lines, 9 miles north east of Sheffield and 8 south west of Doncaster. In the church of St Margaret (rebuilt in 1817) two beautiful Norman arches of the old church are preserved. There are collieries, quarries, and brickfields in the neighbourhood. A large number of persons are employed in the South Yorkshire Railway establishment for the repairing of engines and waggons. There are also flint and glass-bottle works, iron works (for stoves, grates, fenders, and kitchen ranges), and earthenware manufactures. The town was formerly renowned for its Rockingham ware, but the manufacture has been discontinued for some years. A free waiven was granted to Swinton by Henry II. King John, on his march from York to Boston, slept at Swinton old hall. The population of the urban sanitary district (area 1700 acres) in 1871 was 5150, and in 1881 it was 7612.

SWINTON, a large village of Lancashire, is situated on several railway lines, 5 miles north west of Manchester and 6 south-east of Bolton. The Swinton industrial schools, opened in February 1846, are a fine range of buildings of brick with stone facings, surrounded with grounds extending to 20 acres. The church of St Peter, a fine building of stone with a lofty western tower, was erected from the designs of Sir Gilbert Scott in 1869. The manufacture of cotton and coal mining are the chief industries. Anciently a large part of Swinton was possessed by the Knights Hospitallers of St John of Jerusalem. Swinton

and Pendlebury form an urban sanitary district (area 2166 acres) under the government of a local board of twelve members, its population, estimated at 14,052 for 1871, amounted in 1881 to 18,107.

SWITHUN, St, bishop of Winchester from 852 to 862. The name of St Swithun, patron saint of Winchester cathedral from the 10th to the 16th century, is scarcely to be found in any contemporary document. His death is entered in the *Anglo Saxon Chronicle* under the year 861, and his signature is appended to several charters in Kemble's *Codex Diplomaticus*. Of these charters three belong to 833, 838, and some year between 860 and 862. In the first the saint signs as "Swithannus presbyter regis Egberti," in the second as "Swithunus diaconus," and in the third as "Swithunus episcopus." Hence if the second charter be genuine the first must be spurious, and is so marked in Kemble.

More than a hundred years later, when Dunstan and Ethelwold of Winchester were inaugurating their church reform and supplanting the secular canons of the degenerate English foundations by monks, St Swithun was adopted as patron of the restored church at Winchester, formerly dedicated to St Peter and St Paul. His body was taken up from its almost forgotten grave outside the old monastery and transplanted to Ethelwold's new basilica on 15th July 971. Numerous miracles preceded and followed this translation. "We have seen," says one contemporary writer, "the precincts of the monastery so thronged with crowds of ailing folk that a traveller could scarcely make his way to the shrine, and yet, after some days, so numerous were the cures that even within the church itself there were scarcely five sick people to be seen." Another writer, likewise a contemporary, claims to the saint's credit two hundred cures in the short space of ten days.

The revival of St Swithun's fame gave rise to a mass of legendary literature, from which it can only be deduced that towards the end of the 10th century very little was known concerning his career. The so called *Vita Swithuni* of Lantfred and Wulstan, written about this time, hardly contain the very smallest kernel of biographical fact, and all that has in later years passed for authentic detail of St Swithun's life is extracted from a biography, ascribed with much probability to Getzelin, a monk who came over to England with Hermann, bishop of Salisbury from 1058 to 1078. From this writer, who has perhaps preserved some fragments of genuine tradition, we learn that St Swithun was born in the reign of Egbert, and was ordained priest by Helmstan, bishop of Winchester (838-c. 852). His fame reached the king's ears, who appointed him tutor of his son Adolphus (Ethelwulf) and numbered him amongst his chief friends. Under Ethelwulf he was appointed bishop of Winchester, to which see he was consecrated by Archbishop Ceolnoth. In his new office he was remarkable for his piety and his zeal in building new churches or restoring old ones. At his request Ethelwulf gave the tenth of his royal lands to the church. His humility was such that he made his diocesan journeys on foot, and when he gave a banquet he invited the poor and not the rich. He built near the eastern gate of his cathedral city a bridge whose stone arches were so strongly constructed that in Getzelin's time they seemed a work "non levis ruituras." He died 2d July 862, and gave orders that he was not to be buried within the church but outside in "a vile and unworthy place."

William of Mahnesbury adds that, as Bishop Althelm of Sherburne was Ethelwulf's minister for temporal, so St Swithun was for spiritual matters. The same chronicler uses a remarkable phrase in recording the bishop's prayer that his burial might be "ubi et pedibus prateritum et stitendum ex alto rorantibus esset obnoxius." This expression has been taken as indicating that the well known weather myth contained in the doggerel lines—

St Swithun's day if thou dost rain
For forty days it will remain
St Swithun's day if thou be fair
For forty days it will rain na more—

had already, in the 12th century, crystallized round the name of St Swithun, but it is doubtful if the passage lends itself by any straining to this interpretation. Mr Raine has suggested that the legend is derived from the tremendous downpour of rain that occurred, according to the Durham chronicles, on St Swithun's day, 1315 (*Hist. Dunelm.*, pp. xvi 96-7). Another theory, more plausible, but historically worthless, traces it to a heavy shower by which, on the day of his translation, the saint marked his displeasure towards those who were removing his remains. This story, however, cannot be traced farther back than some two or three centuries at the outside, and is at variance with the 10th century writers, who are all agreed that the translation took place in accordance with the saint's desire as expressed by vision. More probable is Mr Earle's suggestion that in the legend as now current

we have the survival of some pagan or possibly prehistoric day of augury, which has sheltered itself and preserved its vitality under the protection of an ecclesiastical saint. This view is supported by the fact adduced in *Notes and Queries* (1st ser., vii p. 137) that in France St Medard (June 8) and St Gervase and St Protas (June 19) are accredited with an influence on the weather almost identical with that attributed to St Swithun in England. Mr Parker professes to detect a shower of rain as the symbol of St Swithun in the elog almanacs (of Queen Elizabeth's time), but Mr Earle doubts the resemblance. Of other stories connected with St Swithun the two most famous are those of the Winchester egg woman and Queen Emma's ordeal. The former is to be found in Gotzelin's life (c. 1100), the latter in Rudborne's *Historia Major*

(15th century),—a work which is also responsible for the not improbable legend that this prelate accompanied Alfred on his visit to Rome in 856.

The so-called lives of St Swithun written by Walston, Lantfred and perhaps others towards the end of the 10th century may be found in *Hollandus's Acta Sanctorum* (July), i. 321-323; *Nabillon's Acta SS O B* vi. 70, &c., vii. 628 &c.; and *Earle's Life and Times of St Swithun*, &c. See also William of Malmesbury *Gest Reg.*, i. 160, and *De Gest. Pont.* 160, 161, 179; Florence of Worcester i. 163; Rudborne on Wharton's *Anglia Sacra*, i. 287; Hardv's *Cut of MSS* i. 513-17; Brand's *Popular Antiquities*, Chambers's *Book of Days*; Ethelwulf's *Tithe Charters*, nearly all of which refer to St Swithun in the body of the text, may be studied in Haddon and Stubbs's *Councils*, i. 676-4, a comparison of the charter on page 612 with Colwell's life (cp. Earle, 67) and William of Malmesbury (*Gest Reg.*, 160; *De Gest. Pont.*, 160) seems to show that these charters, even if forgeries, date back at least to the 11th century, as well as the story of his being Ethelwulf's "alter et duellor."

PART I.—GEOGRAPHY AND STATISTICS

Plate
XII.

General
configu-
ration.

AS the Swiss Confederation consists of a number of small districts, differing from each other in many points, but gathered round a common centre, originally for common defence against a common foe, it is not surprising that its political boundaries do not coincide with those of nature. So we find that Ticino is south of the main chain of the Alps, a large part of the Grisons is east of the Rhine and of the ranges separating it from Tyrol, while Schaffhausen is north of the Rhine, and Porrentruy is in the French plain far down the western slope of the Jura. Putting aside these exceptional cases (all of them outside the original limits of the Confederation), the physical geography of Switzerland may be thus roughly summed up—

(1) To the south there is the main chain of the Alps, which is joined at Mont Dolent (12,566 feet) by the lower ranges running east from the east end of the Lake of Geneva, and which continues to be the boundary up to the Stelvio Pass.

(2) To the north of this main chain of the Alps there is another great range, only slightly inferior in height and extent, which starts from the hills known as the Mont Jorat above Lausanne, rises in the great peaks of the Bernese Oberland and in the Tödi, trends to the north near Chur, and, after rising once more to form the Santis, dies away on the south shore of the Lake of Constance.

(3) The main chain of the Alps and this great north outlier are parallel to each other from Mont Dolent to near Chur, joined for a short space near the Pizzo Rotondo (west of the St Gotthard), they again part near the Oberalp Pass (east of the St Gotthard). Between these two great ranges flow two of the mightiest European rivers, the Rhine towards the east and the Rhone towards the west, their head waters being separated only by the tangled mountain mass between the Pizzo Rotondo and the Oberalp Pass.

(4) To the north of the great north outlier of the main chain of the Alps there are what may be called the plains of Switzerland, really the huge undulating valley of the Aar (and its affluents), to which must be added the Thur valley between the Aar basin and the Lake of Constance.

Thus, omitting the special cases named above, we may roughly describe Switzerland as consisting of two great trenches traversed by two great rivers, and enclosed by two huge mountain masses, together with the enormous valley of the Aar and the smaller one of the Thur, both these shut in by the great north outlier of the main chain of the Alps, the Rhine, and the Jura,—two deeply cut trenches, and two wide and undulating valleys.

The main chain of the Alps rises in Swiss territory to the height of 15,217 feet in Monte Rosa, and its north outlier to 14,026 feet in the Finsteraarhorn. The mean level of the Aar valley has been estimated at 1378 feet, its lowest point being the low-water mark of the Rhine at Basel (914 feet), the lowest level within the Confederation, however, is on the Lago Maggiore (646 feet).

According to the most recent calculations, the total area of the Confederation is 15,964.2 square miles, of which 71.7 per cent., or 11,443.3 square miles, are classed as "productive," 3032 square miles being covered by forests, and 132.3 square miles by vines. Of the other 28.3 per cent., or 4520.9 square miles (classed as "unproductive"),

709.9 are occupied by glaciers, 520.3 by lakes, 90 by beds of rivers and streams, and 62.1 by towns, villages, and buildings. Of the whole area the three great cantons of the Grisons, Bern, and Valais take up 7439.9 square miles, or nearly one half, while, if to them be added Vaud, Ticino, and St Gall, the extent is raised to 10,552 square miles, or about two thirds of the entire Confederation.

The total area of Switzerland (15,964.2 square miles) is distributed over four great river basins (draining to three different seas) in the following proportions—Rhine 11,166, Rhone, 2717, Po, 1358, and Inn, 721.

The Rhine basin is by far the largest in Switzerland, and drains of course to the North Sea. The Rhine itself is formed of two branches,—Vorder Rhine (valley of Dissentis) and Hinter Rhine (from the Splügen and St Bernardine),—which unite at Reichenau, near Chur. The joint stream receives several mountain torrents, expands into the Lake of Constance, and then turns west receiving the Thur, and opposite Waldshut the great stream of the Aar, finally leaving Swiss territory at Basel, where it turns north. Its main affluent is the Aar, the basin of which covers no less than 6794 square miles. This stream rises in the glaciers of the Bernese Oberland, expands into the Lakes of Brienz and of Thun, receives from the left the Kander, the Saane, and the Zihl, and from the right the Emme, as well as (near Brugg, that great meeting place of the waters) the Reuss flowing through the Lake of Lucerne and the united stream of the Linth and the Limmat flowing through the Lakes of Wallenstadt and Zurich. It is interesting historically to note the fact that the thirteen cantons which till 1798 formed the Confederation are all comprised in the Rhine basin, the ten oldest (i.e., all before 1500) being within that of the Aar, and that it was only after 1798 that certain Romansh, French, and Italian speaking "allies" and subject lands—with their respective river basins—were tacked on. The Rhone rises in the glacier of the same name and flows west, receiving the mountain torrents of the Visp, the Lonza, and the Dranse, besides others, expands into the Lake of Geneva, and a little way from Geneva quits Swiss territory on its way to the Mediterranean. The main stream flowing from Switzerland to the Po basin is the Ticino (from the St Gotthard), which widens into the Lago Maggiore, another stream expands into the Lake of Lugano, and others run into the Lake of Como,—all finally joining the Po in the Lombard plains, thus draining to the Adriatic. The Ramm, flowing through the Munsterthal, joins the Adige and so drains into the Adriatic. The Inn basin is composed of the upper part of the river (above Martinsbruck) and drains into the Danube and so into the Black Sea.

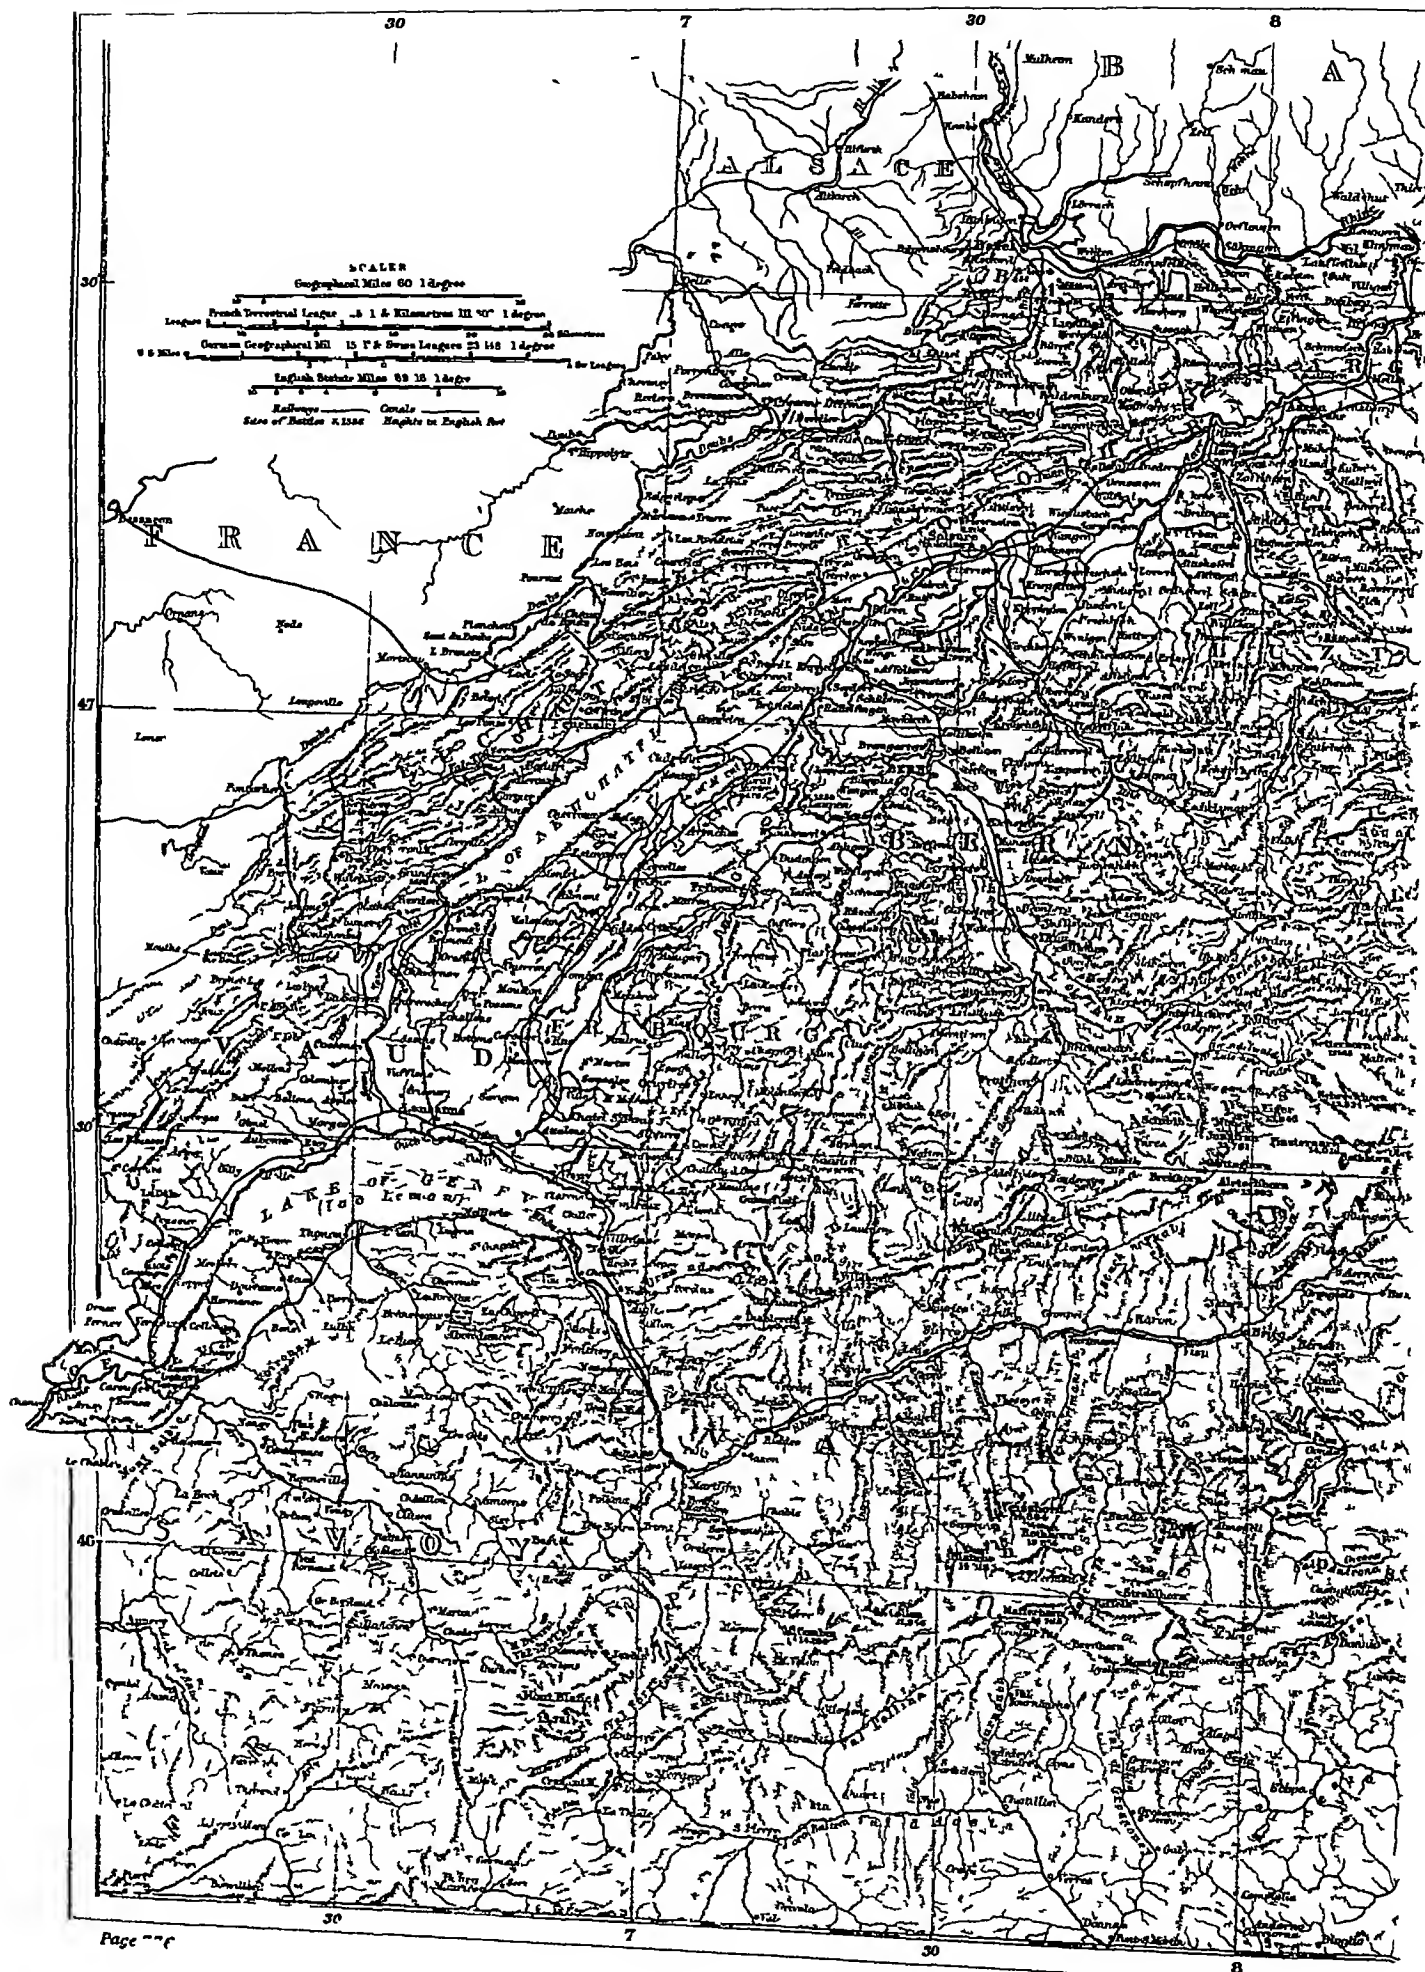

Most of the great Swiss rivers, being in their origin mere mountain torrents, tend to overflow their banks, and hence much is required and has been done to prevent this by embanking them, and regaining arable land from them. So the Rhine (between Ragatz and the Lake of Constance), the Rhone, the Aar, the Reuss, and in particular we may mention the great work on the Linth (1807 to 1822) carried out by J. Konrad Escher, who earned by his success the surname of "Von der Linth" and on the Zihl near the Lakes of Neuchâtel and Biennne, while the diversion of the Kander from its junction with the Aar at Utendorf to a channel by which it flows into the Lake of Thun was effected as early as 1714.

There are very many lakes in Switzerland. The two largest Lakes (Geneva and Constance) balance each other at the south west and north east corners of the Confederation. The following list gives details regarding the fifteen over 4 square miles in extent. It will be noticed that of these twelve are in the Rhine basin (eleven of

¹ The hydrographic bureau of Switzerland publishes annually a series of graphic tables representing the seasonal changes in the volume of all the important rivers.

Area.

them being in that of the Aar, two in the Po basin, one in the Rhone basin, and none at all in the Inn basin. It has been estimated that in the Rhone basin there are no fewer than nineteen large and thirty seven small lakes. Of the smaller Swiss lakes we may mention the Dauben See and the Oeschinen See, as well as the Vargelen See close to the Gross Aletsch glacier. There are of course an infinite number of Alpine tarns.

Name of Lake	River Basin	Area in Square Miles	Mean Height of Surface above Sea Level in Feet	Approximate Depth in Feet
Geneva*	Rhone	223	1230 3	984 3
Constance*	Rhone	208 1	1305 8	905 5
Neuchâtel	Aar, Rhone	92 3	1427 2	472 4

Hallwil	Aar, Rhone	4	1483	1522 8

The lakes marked * are only partly in Swiss territory.

Water-falls. There are a great number of waterfalls in Switzerland, the loftiest being that of the Staubbach (1001 feet), in the valley of Lauterbrunnen, or "Clear Springs" (Bernese Oberland). In the Oberland, too, we find the Handek (200-220 feet), near the source of the Aar, while the Reichenbach descends in seven falls and the Giesbach in thirteen. The falls of the Rhone at Schaffhausen contain an enormous mass of water, though they are only 82 feet in height. In southern Switzerland the Pissevache fall (200 feet), in the Rhone valley, is the best known.

Glaciers. Dr A. Heim reckons up 471 glaciers in Switzerland and 462 in Austria, his figures for France and Italy being untrustworthy and incomplete, but Switzerland has 138 glaciers of the first rank (i.e., over 4½ miles long) as against 71 in Austria, though Austria has 391 of the second rank (i.e., between 4½ and 3 miles long) as against 333 in Switzerland. The distribution of the Swiss glaciers deserves notice, for in eleven cantons (that is, half of those in the Confederation) there are no glaciers at all, while in five others (Unterwalden, Vaud, St. Gall, Schwyz, and Appenzell) they only cover about 13 square miles out of 709 square miles of ice and snow in the Confederation, according to the official survey. Valais heads the list with 375½ square miles, then come the Grisons (138 6), Bern (111 3), Uri (44 3), Glarus (13 9), and Ticino (13 1). The longest glacier in the Alps is the Gross Aletsch in the Bernese Oberland, 15 miles long, it has a basin of 49 8 square miles and a maximum breadth of 1968 yards. In point of length the Untervar glacier comes next (10 4 miles), followed by the Gorner and Viescher glaciers (each 9 4 miles). The lowest point to which a Swiss glacier is known to have descended is 3225 feet, attained by the Lower Grindelwald glacier in 1818. Dr Heim has ascertained that the maximum annual snowfall in the Alps takes place in the lower snow regions—a conclusion which the present writer can confirm from personal experience gained on the ascent of several of the highest Oberland peaks in January 1874 and 1879. Dr Heim states that in the central Alps of Switzerland the limit of perpetual snow varies from 9259 to 9023 feet. See GLACIERS.

Climate. In Switzerland, where the height above sea level varies from 646 feet (Lago Maggiore) to 15,217 feet (Monte Rosa), we naturally find very many climates, from the regions of olives, vines, oaks and beeches, pines and firs, to those of high mountain pastures, rhododendrons, and of eternal snow (see ALPS). As regards the duration of the seasons, there is a corresponding variety. It has been reckoned that, while in Italian Switzerland winter lasts only three months, at Glarus it lasts four, in the Engadine six, on the St. Gotthard eight, on the Great St. Bernard nine, and on the St. Theodule always. A painstaking writer has calculated that, if Switzerland were flattened out into a plain, and reduced to the level of the sea, it would be comprised between the isotherms 51° S and 55° 4 F. As a matter of fact the mean temperature varies no less than 34½° for at Bellinzona it is 54½° F, at Geneva 49½°, at Basel 40½°, at Chur 48½°, at Interlaken 48°, while on the Great St. Bernard it sinks to 30°, and on the St. Theodule to 20°. The Alps form the boundary between the region where the rain fall is greatest in summer and that where it is greatest in autumn, the winter and spring rainfall varying but slightly. These are the percentages of the annual rainfall in Switzerland at different seasons—

Rhone Basin	winter, 18, spring, 25, summer, 33, autumn, 24
Rhone Basin	" 21, " 26, " 28, " 27
Ticino Basin	" 12, " 26, " 27, " 35

It has been shown by careful observations that the rain (or snow) fall is greatest as we approach the Alps, whether from the north or south, the flanks of the great ranges and the valleys opening out towards the plains receiving much more rain than the high Alpine valleys enclosed on all sides by lofty ridges. Thus the annual rainfall is 35 inches at Basel but 64½ at Beatenberg (above Interlaken) and 69 at Schwyz, rising to 88 on the Grimsel and 102 on the St. Bernardine, and falling again at Lugano to 63. Dr Heim calculates that the percentage of snow in the total annual rainfall in Switzerland varies from 63 on the Great St. Bernard to 6 at Geneva, the mean fall of 34 being at Platta in the Grisons. Thunderstorms generally vary in frequency with the amount of rainfall, being most common near the great ranges, and often very local. The floods caused by excessive rainfall are sometimes very destructive, as in 1839, 1852, and 1868, while the same cause leads to landslips, of which the most remarkable have been those on the Rossberg above Goldan (1806), at Evionnaz (1835), and at Elm (1881).

As regards the larger cyclones or storms of Europe, a south wind in the Alps indicates that the barometrical minimum is in the English Channel, a west wind that it is in the North Sea, a north wind that it is in the Eastern Alps, and an east wind that the depression is in the Mediterranean, about Corsica. When the barometrical minimum shifts from the Atlantic over Scandinavia to Russia, a south west wind in the Alps is followed by west and then north winds. The "fohn" is the most remarkable of the local winds in Switzerland,—a strong south west or south wind, very hot and very dry. It was formerly supposed to come from the Sahara, but is now held to be a south west or south wind which, saturated with moisture, crosses the Alps, precipitating a copious rainfall in its course, commencing its descent in the northern valleys with a high temperature for those great heights, it necessarily increases in temperature and dryness as it passes into the high pressure of lower levels. Dr Hann concludes from observation that, assuming the air to cool at the rate of 1° C in every 100 metres of ascent, and the ridge crossed by the fohn to be 2000 metres in height, the heat lost on the ascent is only 0° 5 C, so that when the fohn reaches the north side it will have a heat, not of 10°, but of 20°. The fohn occurs most frequently in spring. Other local winds in the Alps are those which blow up a valley in the morning and down it in the evening, due to the heating of the air in the valleys by the sun during the day and its cooling by terrestrial radiation at night. The cloud streamers from great Alpine peaks are due to the condensing of the moisture in a layer of air, and, as the moisture is carried away by the wind, so the streamer is dissolved.

For all these reasons Switzerland has many varieties of climate, and, while, owing to the distribution of the rainfall, the Ticino and Aar valleys are very fertile, the two great trenches between the main chain and its north outlier, though warm, are less productive, as the water comes from the rivers and not from the skies.

Asphalt is the only raw mineral product the export of which exceeds the import, and it is obtained only in the canton of Neuchâtel, where the output of the Val de Travers deposit in 1883 reached 28,000 tons. Though iron ores are known (according to Weber and Brosi's map) to exist in 13 localities, gold in 3, silver in 22, copper in 29, lead in 27, nickel and cobalt in 2, tin in 1, sulphur in 3, Switzerland is practically dependent for all its metals on foreign supply. While 35,161 tons of iron were obtained in 1870 (mostly from mines in the Jura), only 19,045 were obtained in 1881. True coal is wholly absent, lignites, however, occur both in the Tertiary and the Quaternary formations, the most important workings being those of Kapfureh, Uznach, Morschwil, Dürnten, Lutry, Conversion, and Oron. In 1870 the output was 33,364 tons, in 1881 only 6184. Anthracite occurs in Valais. Peat is common in many parts. Salt (42,000 tons) is procured from wells in Aargau, Basel, and Vaud. The first salt deposit was discovered in 1836 at Rothenhaus (Basel canton), that of Rheinfelden in 1844, of Rapperswil in 1845, and of Kaiserangst in 1865. The wells at Bex have been worked since 1554.

Game is not abundant in any part of Switzerland, and rigorous game laws and other devices have been adopted in order to increase the number of wild animals. In 1875 a law was passed in accordance with which a commission marked out certain reservations or "districts francs pour la chasse au gibier de montagne" and in 1881 their limits were revised for another term of five years, including an area of 5268 square kilometres in 1885. There were then within this area 8487 chamois and about 106 roebucks. The chamois were most abundant in the Grisons, Bern, Glarus, and Freiburg. In the Alpine regions the marmot and Alpine hare are still common, and their numbers have increased under the protective system. Grouse, partridge, wild duck, and snipe are the

1 In his epoch making work, *Handbuch der Gletscherkunde*, Stuttgart, 1860.

chief game birds. A close time protects birds not considered game, and the federal council in 1885 appointed a commission to draw up a catalogue of all birds found in Switzerland, and to establish stations for collecting facts of ornithological interest.

Fisheries

Attention has recently been directed to the diminution of the supply of freshwater fish, due in part to over fishing and in part to pollution of the streams. It is estimated that the fish bearing waters in the whole country cover an aggregate area of 1581 square kilometres (1348 belonging to lakes and 233 to rivers and streams), the cantons with the greatest areas being Vaud (443 square kilometres), Bern (161), Thurgau (139), and Neuchâtel (93). Close seasons, and in certain places close years, have been established, and numerous fish hatcheries are also in operation (57 in 1885), the species treated being mainly salmon, lake trout, river trout, grayling (omble), red trout or Rothel, the Swiss *Coregonus*, American *Coregonus* (*C. albus*), *Salmo fontinalis*, and the "mader." No fewer than 5,709,432 fish were introduced into the lakes and rivers in 1885. By a law of 1884 the federal council is allowed to defray

one third of the expense of the construction of fish-ladders. In 1882 a Swiss fisheries society was founded. Conventions in regard to the fisheries have been signed with Italy, France, and Germany.

Great importance attaches to the domestic animals of Switzerland. In 1876 there were 284,478 owners of live stock, in 1886 stock, 289,610. The following are the numbers for those two years — horses, 100,935 and 98,333, cattle, 1,035,930, 1,211,713, sheep, 367,549, 341,632, goats, 396,055, 415,916, pigs, 334,515, 394,451, mules, 3145, 2741, asses, 2113, 2042, and beehives, 177,825, 207,180. See *Z. f. schw. Statistik*, 1886.

The following table gives a variety of details regarding the twenty two Swiss cantons, arranged in the order of their extent. In the first column the languages principally spoken in the different cantons are indicated by letters, as described in the appended footnote, and the percentages of population speaking them in 1880 are given. In every case the official language is that of the majority, with the exception of Freiburg, where it is German. The same column also shows the various executive and legislative authorities.

Canton *	Date of Admission	Date of Present Constitution.	Area in English Square Miles	Population		Density per Square Mile	Deputies in National Rath	Cantonal Capital	Population of Capitals

Census returns

The first federal census of which the results were published was neither quite synchronous (April 1836 to February 1838) nor quite systematic. That of 1850 took account only of the population with right of residence (*population domiciliée*), and not of the population actually present at the date of the census. In 1860 the census was declared decennial. The following are the numbers returned — March, 18-23, 1850, 2,392,740, December, 10, 1860, 2,507,170, December 1, 1870, 2,669,147, December 1, 1880, 2,846,102.

Density of population

As regards density of population, Switzerland, with 198 5 persons to the square mile, stands considerably above Scotland (125) and a long way below England and Wales (446). The Alpine region is the sparsest generally, though certain districts, like Appenzell Aargau Rhoden, are very densely peopled, the Jura region has a much higher ratio, and the densest region of all is the Swiss plateau. If we draw an irregular line from the east end of the Lake of Geneva by Thun, Lucerne, and the south of the Lake of Zurich to Rheineck, we shall have nearly all the more densely populated portions of the country to the north, the only notable exception being what might be called the Swiss peninsula of Lugano. A large proportion of the country to the south has only from 1 to 19 inhabitants to the square kilometre. The districts where the density rises above 250 to the square kilometre are that to the south east and south west of Geneva, the vicinity of Lausanne, the districts of Chaux de Fonds, Neuchâtel, Biel, Bern, Soleure, Basel, a large tract along both sides of the Lake of Zurich, and the district between St Gall and Rheineck. The districts in which an increase of population had taken place between 1870 and 1880 are curiously distributed. An increase of 20 per cent. or over occurs only in the environs of Basel and in two large areas of which the chief centres are Altdorf and Airolo. Decrease was prevalent throughout a large part of the better populated regions of the north, while a certain increase had taken place throughout much of the south western area.

In 1880 there were 960 8 males to every 1000 females, a rather smaller preponderance of females than in England and Wales. For every 1000 above the age of 50 there are 176 unmarried females to 154 unmarried males. The disproportion of the sexes in the country at large is mainly due to emigration, but in certain cantons it is partly due to excess of women in the immigrants from neighbouring countries. In Uri, Schwyz, and Valais only is there an excess of males. In every 1000 of the population there were, in 1860, 296 under 15 years of age, 620 between 15 and 60 years, and 84 upwards of 60, the corresponding figures in 1870 being 315, 595, and 90, and for 1880, 319, 593, and 88. The proportion of married persons to the total number of the adults (47 4 per cent.) is less than in most other countries, though this proportion has been gradually raised both before and since 1880 by certain legislative changes, including the new marriage law in 1874. At the same time the average fertility of the marriages has decreased. Early marriages on the part of the males are slightly more frequent than in England. Divorce and separation are frequent. Thus in 1876-80 they formed nearly 5 per cent. of the marriages, while in Belgium and the Netherlands they do not reach 1 per cent. As regards the marriage relations of the different creeds, the five years 1877-81 showed that (excluding the canton of Geneva, where the creed is not registered) there were only 0 7 separations per 1000 existing marriages where both husband and wife were Catholics, 2 8 where both were Protestants, 3 2 where the husband was a Catholic and the wife a Protestant, and 4 5 where the husband was a Protestant and the wife a Catholic.

The percentage of illegitimate births during the years 1871-77 was 5 7, 5 2, 5 1, 4 8, 4 4, 5 0, and 4 9 respectively, a rate almost identical with that of England and Wales. Infant mortality has been decreasing. While 20 32 per cent. of the quick born children of 1876 died in their first year, only 17 3 died in 1885.

The following table shows the annual number of births, &c —

	Marriages	Per 1000	Births	Per 1000	Deaths	Per 1000
1871-75	21,732	8.0	85,832	31.6	64,479	23.8
1876-80	20,740	7.4	91,197	32.5	64,671	23.1
1881-84	19,708	6.8	85,612	29.6	61,082	21.1
1885	20,105	6.8	83,579	28.6	61,548	21.0

Foreigners At the census of 1880 there were in Switzerland 211,035 foreigners (112,311 males and 98,724 females), or one foreigner to every 13 or 14 of the population. The origin of this alien element was very various—from Alsace Lorraine, 2607 males, 2732 females, Germany, 43,923, 45,991, Austria Hungary, 8389, 4929, Italy, 27,821, 13,709, Spain and Portugal, 175, 93, France, 26,264, 27,389, Holland and Belgium, 445, 493, Great Britain, 1027, 1785, Russia, 599, 685, Servia, Rumania, and Greece, 119, 35, Denmark, Norway, and Sweden, 194, 188, America, 563, 548.

Emigration Between 1868 and 1877 the average number of emigrants from Switzerland was 3516 per annum, between 1878 and 1882 it was 7196. In 1883, 1884, and 1885 the figures were respectively 13,502 (12,758 of them native born Swiss), 9608, and 7583. By far the greater proportion of the emigrants found their way to America, and mainly to the United States, though some of the South American republics (as Chili) attract a considerable number. In the five years 1876-80 3172 persons on an average left for North America annually, 99 for Central America, 594 for South America, and 107 for Australia, while Asia and Africa together did not count more than 167.

Cities The population is to a very great extent rural. Only three cities (Zurich, Geneva, and Basel) have a population exceeding 50,000, and at the census of 1880 only 59 other towns had each more than 4000 inhabitants. Of these Bern (see table above), Lausanne, Chaux de Fonds (22,456), St Gall, Lucerne, Neuchâtel, Winterthur (13,595), Schaffhausen, Biel (11,623), Freiburg, Hertenau (11,082), and Locle (10,464) exceeded 10,000.

Religion A religious census was taken in 1850, 1860, 1870, and 1880, in the first case only three categories were recognized—Catholic, Protestant, and Jew, in 1860 and 1870 four—Catholic, Protestant, Christians of other denominations, and non-Christian. After much discussion the federal council, which had proposed to drop the religious census in 1880, was prevailed upon by the arguments of ten cantons to adopt a similar classification in 1880. The figures in 1870 were—1,566,347 Protestants, 1,084,369 Catholics, 11,435 members of other sects, and 6996 Jews, in 1880 the Protestants numbered 1,667,109, the Catholics 1,160,782, the Jews 7373, and miscellaneous 10,838. The Jews are most strongly represented in the cantons of Bern (1316 in 1880), Basel (1053), Aargau (1234), Zurich (806), Neuchâtel (689), and Geneva (662).

Agricultural statistics. It has been estimated that, of the whole area of Switzerland, 1,642,471 acres are under arable cultivation and 1,917,632 acres in forest, while 2,866,113 acres are altogether unproductive. Agricultural statistics have never been systematically registered by the federal authorities, and only a few of the cantons have devoted serious attention to the matter. Herr C Muhlemann (*Zf schweiz Stat*, 1886) gives the following estimate of the area cropped and the annual value (in thousands of francs) of the produce —

	Acres	Value		Acres	Value
Wheat	153,708	76,054	Other fodderplants	15,632	2,666
Spelt	103,993	47,746	Cease and beans	9,74	1,060
Rye	86,089	18,801	Rape	1,966	486
Barley	73,110	5,017	Hemp and flax..	12,473	6,101
Oats..	122,647	20,468	Chicory	2	78
Potatoes	261,938	79,519	Tobacco	1,770	701
Beet and turnips	43,810	13,214	Veg. etable..	41,740	4,842
Carrots	16,016	3,148	Meadows, good..	629,122	1,3612
Mixed fodder	733,612	86,677	" medium	1,09,565	82,998
Clover	217,897	66,048	" poor..	578,940	28,115
Lucerne	27,744	7,449	Pastures and "alps	1,962,000	1,99,001
Esparect	89,324	19,740	Inclyards	79,020	67,719

The value of the fruit produce is given as 127,418,391 francs (apples, 71,316,992, pears, 38,656,150).

"Allmends" The name "allmends" is given to land still held in common, whether arable, meadow, pasture, or forest. The main part of the "allmends" now existing consists of pasture and forest land.

"Alps" The pasture lands, "alps," or high mountain pastures comprise "weiden" used in the spring "mittelalpen," or cow pastures, and "hochalpen" (sometimes 9000 feet above the sea), for sheep and goats. They are most numerous in Neuchâtel, Bern, and Grisons. The capital value of the whole is estimated at 200,000,000 francs or more. Of the 3032 miles of forest land 127.3 belong to the state, 2007.1 to "communes" or private associations, and 897 to private persons. The federal Government has done much to reforest tracts, both by itself and by stimulating cautious effort, and generally to promote the science of forestry.

Forest- The silk industry of Switzerland was already established at

Zurich and Basel in the latter half of the 13th century, but after a period of prosperity it died out. It was again introduced by the Protestants expelled from Locarno in 1555. Crape, velvet, and taffetas were the favorite products of the first stage, ribbon weaving came later with another band of Locarno refugees and the French Huguenots. In 1872 116 firms were engaged in the silk trade, in 1881 134. Between these dates the employees had increased from 39,940 to 49,816 (65,000 in 1883), and the wages from 15,382,186 to 19,815,453 francs. In 1881 2,153,100 kilos of raw silk and 1,067,700 of silk waste were imported, and the export of silk goods, ribbons, and ferret silk was 1,152,300, 1,965,400, and 819,000 kilos respectively. Cotton began to be manufactured in Switzerland in the 15th century, and power loom weaving was introduced in 1830. The industry has owed a good deal to the abundant water power of the country. In 1881 there were about 23,000 cotton looms, and cotton spinning employed about 60,000 spindles. The workers numbered 85,046 in 1883. Bleaching and cloth dressing have attained a great development in the neighbourhood of St Gall, both in the cantons of St Gall and Appenzell. Printworks are especially numerous in Glarus. Aargau is the chief seat of the woollen manufacture, having 4 millions of the total production valued at 11½ million francs. Linen, the first of the Swiss textile fabrics to find its way to a foreign market, is no longer manufactured on a large scale. Embroidered goods are the great specialty of the export trade of eastern Switzerland,—the cantons of St Gall, Appenzell, Thurgau, and part of Zurich. In flat stitch machine embroidery 15,256 workers were employed in 1872, and 27,801 in 1880 (43 and 47 per 1000 inhabitants). In the different departments of hand embroidery 33,359 persons were employed in 1881. The St Gall market is also supplied by a large number of workers in Verarlberg. The value of the embroidered goods exported from the consular district of St Gall for America alone increased from 19 to nearly 30 million francs between 1879 and 1882. Straw plaiting is an important industry in Aargau (centre at Wohlen), Thurgau, and Freiburg. In 1867-68, when the trade was at its best, the total export was worth 10½ million francs. Watch and clock making is a specially Swiss industry, giving employment to 44,000 workers in 1883. In Geneva alone 296 establishments were at work in 1882 in some department or other of the manufacture. The valley of Joux (Vaud and Saint Croix), Chaux de Fonds, Locle, Les Brenets, Les Ponts, Fleuville (Neuchâtel), Bienne, Porrentruy, Saint Imier (Bern), Granges (Soleure), Waldenberg (Basel), and Schaffhausen are all important seats of the craft. The condensed milk industry of Switzerland is also well known. The exports in 1875 amounted to 4,261,800 kilos, and in 1883 to 12,086,900. A similar article is Nestlé's infants food from Vevey. Swiss cheese (Emmenthal and Gruyère) has a widespread reputation, the export increased from 5,093,100 kilos in 1881 to 25,959,400 in 1883. The production of beer in Switzerland was 6,160,000 gallons in 1867 and 20,240,000 in 1882, in the latter year 289,564 gallons were exported. The distilleries (1006) produce about 990,000 gallons of pure alcohol annually. Allusion can only be made here to the great chemical industries of the country, its potteries, paper mills, engineering works, gun factories, &c.

Wood carving was one of the most ancient, as it is now one of the best known, of the minor arts of Switzerland. The great seat of the modern industry is the Bernese Oberland, where the peasants during the long evenings of winter for centuries devoted themselves to producing artistic articles in wood. It was regularly organized by Christian Fischer in Brienz (1825), and is now mainly in the hands of a company, founded in 1881, which associates capitalists and workmen in the profits. In 1870 1139 men and 56 women were employed throughout Switzerland in this department, in 1880 the numbers were 1202 and 105.

Owing to the original abundance of timber it was almost the only wood material employed in the building of houses. There are practically three styles: the so called block house, in which the logs are laid one upon the other, the post built house, in which upright posts and a strong framework are filled in with planks, and the "riegel haus," in which a framework of wood is filled in with brick or stones. In the cantons of Zurich, Thurgau, and Schaffhausen the riegelhaus (the usual form in southern Germany) has—chiefly owing to the increased cost of timber—displaced the two other styles, which alone were in use there till the beginning of the 17th century.

In Geell Fels's *Bäder u. Klimatische Kurorte der Schweiz* (1880) Health 505 health stations are mentioned. In Aargau we have the hot springs of Bâle and Schinznach (sulphur), the salt baths of Rheinfelden and Mumpf, the mineral waters of Wildegg and Birmensdorf. In Appenzell there are a number of places between

chief game birds. A close time protects birds not considered game, and the federal council in 1885 appointed a commission to draw up a catalogue of all birds found in Switzerland, and to establish stations for collecting facts of ornithological interest.

fisheries

Attention has recently been directed to the diminution of the supply of freshwater fish, due in part to over fishing and in part to pollution of the streams. It is estimated that the fish bearing waters in the whole country cover an aggregate area of 1681 square kilometres (1348 belonging to lakes and 233 to rivers and streams), the cantons with the greatest areas being Vaud (448 square kilometres), Bern (161), Thurgau (139), and Nendach (98). Close seasons, and in certain places close years, have been established, and numerous fish hatcheries are also in operation (57 in 1885), the species treated being mainly salmon, lake trout, river trout, grayling (ombré), red trout or Rothel, the Swiss *Coregonus*, American *Coregonus* (*C. albus*), *Salmo fontinalis*, and the "mader." No fewer than 5,709,432 fish were introduced into the lakes and rivers in 1885. By a law of 1884 the federal council is allowed to defray

one third of the expense of the construction of fish ladders. In 1882 a Swiss fisheries society was founded. Conventions in regard to the fisheries have been signed with Italy, France, and Germany.

Great importance attaches to the domestic animals of Switzerland. In 1876 there were 284,478 owners of live stock, in 1886 289,610. The following are the numbers for those two years — horses, 100,935 and 98,333, cattle, 1,035,930, 1,211,713, sheep, 367,549, 341,632, goats, 396,055, 415,916, pigs, 334,515, 394,451, mules, 3145, 2741, asses, 2113, 2042, and beehives, 177,825, 207,180. See *Z f schwe Statistk*, 1886.

The following table gives a variety of details regarding the twenty two Swiss cantons, arranged in the order of their extent. In the first column the languages principally spoken in the different cantons are indicated by letters, as described in the appended foot note, and the percentages of population speaking them in 1880 are given. In every case the official language is that of the majority, with the exception of Freiburg, where it is German. The same column also shows the various executive and legislative authorities.

Census returns

The first federal census of which the results were published was neither quite synchronous (April 1836 to February 1838) nor quite systematic. That of 1850 took account only of the population with right of residence (*population domiciliée*), and not of the population actually present at the date of the census. In 1860 the census was declared decennial. The following are the numbers returned — March, 18-23, 1850, 2,392,740, December, 10, 1860, 2,507,170, December 1, 1870, 2,669,147, December 1, 1880, 2,846,102.

Density of population

As regards density of population, Switzerland, with 198 5 persons to the square mile, stands considerably above Scotland (125) and a long way below England and Wales (446). The Alpine region is the sparsest generally, though certain districts, like Appenzell Auser Rhoden, are very densely peopled, the Jura region has a much higher ratio, and the densest region of all is the Swiss plateau. If we draw an irregular line from the east end of the Lake of Geneva by Thun, Lucerne, and the south of the Lake of Zurich to Rheineck, we shall have nearly all the more densely populated portions of the country to the north, the only notable exception being what might be called the Swiss peninsula of Lugano. A large proportion of the country to the south has only from 1 to 19 inhabitants to the square kilometre. The districts where the density rises above 250 to the square kilometre are that to the south east and south west of Geneva, the vicinity of Lausanne, the districts of Chant de Fonds, Neuchâtel, Biel, Bern, Solcure, Biel, a large tract along both sides of the Lake of Zurich, and the district between St Gall and Rheineck. The districts in which an increase of population had taken place between 1870 and 1880 are curiously distributed. An increase of 30 per cent or over occurs only in the environs of Basel and in two large areas of which the chief centres are Altdorf and Airolo. Decrease was prevalent throughout a large part of the better populated regions of the north, while a certain increase had taken place throughout much of the south western area.

In 1880 there were 960 8 males to every 1000 females, a rather smaller preponderance of females than in England and Wales statistics. For every 1000 above the age of 50 there are 176 unmarried females to 154 unmarried males. The disproportion of the sexes in the country at large is mainly due to emigration, but in certain cantons it is partly due to excess of women in the immigrants from neighbouring countries. In Uri, Schwyz, and Valais only is there an excess of males. In every 1000 of the population there were, in 1860, 296 under 15 years of age, 620 between 15 and 60 years, and 84 upwards of 60, the corresponding figures in 1870 being 316, 595, and 90, and for 1880, 319, 593, and 88. The proportion of married persons to the total number of the adults (47 4 per cent) is less than in most other countries, though this proportion has been gradually raised both before and since 1880 by certain legislative changes, including the new marriage law in 1874. At the same time the average fertility of the marriages has decreased. Early marriages on the part of the males are slightly more frequent than in England. Divorce and separation are frequent. Thus in 1876-80 they formed nearly 5 per cent. of the marriages, while in Belgium and the Netherlands they do not reach 1 per cent. As regards the marriage relations of the different creeds, the five years 1877-81 showed that (excluding the canton of Geneva, where the creed is not registered) there were only 0 7 separations per 1000 existing marriages where both husband and wife were Catholics, 2 8 where both were Protestants, 3 2 where the husband was a Catholic and the wife a Protestant, and 4 5 where the husband was a Protestant and the wife a Catholic.

The percentage of illegitimate births during the years 1871-77 was 5 7, 5 2, 5 1, 4 8, 4 4, 5 0, and 4 9 respectively, a rate almost identical with that of England and Wales. Infant mortality has been decreasing. While 20 32 per cent. of the quick born children of 1876 died in their first year, only 17 3 died in 1885.

2000 and 3000 feet above the sea famous as whey cure stations (Heiden, Gais, Appenzel, &c.), and various chalybeate springs (Weissbad, Gouten, Heinrichsbad). Basel contains salt baths at Schweizerhalle, Bienenberg, and Schauenburg. Bern is particularly rich in baths and sanatoriums (Lenk, Weissenburg, Heinstrieh, Gurnigel, Engstein, Blumenstein). Schwarzebad is the chief mineral spring in Freiburg, Pfaffers-Ragatz in St Gall is world famous. The Stachelberger Schwefelbad in Glarus is much frequented. The Grisons have almost a superfluity of mineral waters, some of which (St Moritz, Fideris) are exported in large quantities. Weissenstein in Soleure is one of the oldest sanatoriums in Switzerland. Lavey and Bex in Vaud are respectively famous for their sulphur and salt baths. In Valais, Saxon and Leukerbad are famous. The importance of altitude in the attractiveness of a health resort is shown in a table by Guyer, 280 of the hotels for foreign visitors being upwards of 3900 feet above the sea. Dr F Stöpel (*Industrie u. Handelspolitik der Schweiz*, 1876) reckoned the total receipts from foreign visitors at 120,000,000 francs.

Com
merce

The position taken by Switzerland in the trade and commerce of the world is remarkable when the various natural obstacles are considered—such as absence of raw material for her industries, costly and difficult means of transport, and restrictive customs established by neighbouring countries. The following table shows the value in thousands of francs of the imports and exports for 1885 (the first year for which we have official returns) —

	Imports	Exports		Imports	Exports
Germany	249,282	157,620	Russia	21,318	9,481
France	173,195	139,670	United States	17,842	77,723
Italy	117,090	60,318	Egypt	12,217	2,183
Austria Hungary	60,603	37,726	Holland	9,288	5,879
Great Britain and Ireland	51,604	99,396	Other countries	10,608	56,889
Belgium	26,372	13,076	Total	765,452	659,964

England is the great market for silver watches, Germany for gold watches and musical boxes, France for weaving machinery, Russia for mills, Italy for miscellaneous machinery, France for asphalt, France for butter, France, Italy, Germany, and the United States for cheese, Germany for silk, Germany for cattle, France for sheep and goats. Cotton manufactures find their way to France, Italy, Austria, Britain, Germany, Spain, India, &c., leather to the United States and the Argentine Republic. The customs increased from 3,953,192 francs in 1850 to 21,342,403 in 1884.

Educa
tion.

By article 27 of the federal constitution of 1874, primary instruction, while left in the charge of the several cantons, is required to be sufficient, obligatory, gratuitous, unsectarian, and under public control of the state. The primary school age is up to twelve years, as far as this general law is concerned, but in some cantons this is raised to fourteen, fifteen, or sixteen years of age. The first school year also varies from five to seven in different cantons. Great variety indeed exists in the whole school organization of the several cantons, while the chief authority as regards the primary schools is in some cases vested in an educational department or educational council, or both, in others it is entrusted to an educational director with or without a council. Considering the difficulties caused in many regions by a sparse population and a rugged country, primary instruction is well carried out. Funds are provided by the state, the commune, and often by the private individual. Even in remote districts the school buildings are generally good. Bern has been especially active in building new schools. In 1882 218,191 boys and 215,889 girls attended the primary schools. Of these 311,271 had German as their mother tongue, 97,113 French, 19,864 Italian, and 5882 Romansech. The total number of male teachers was 5340, and of female teachers 2525, the average pay in money per male teacher was 1303 francs, for female teachers 822 francs. The primary school property was valued at 187,534,597 francs (86,647,507 in 1871). The expense was 14,781,610 francs (8,708,174 in 1871). The communes contributed 8,349,697 francs and the state 2,825,722. The expense per scholar was 34.1. For the school children who are too poor to obtain proper food and clothing both public and private assistance is freely rendered. Besides the ordinary public primary schools, there are a considerable number of secondary schools (attended in 1882 by 11,155 boys and 6076 girls), preparatory (or intermediate) schools (8556, 2133), and private schools (10,864, 11,242), schools for adults (12,758, 1110), and private schools (6057, 4834). In 1882 there were in all 272,039 preparatory schools are the "colleges" or "gymnasiums" and the industrial schools, one of which exists in almost all the cantonal capitals as well as at Winterthur, Burgdorf, Porrentruy, Einsiedeln, Murten, and Breg. In Grisons and Neuchâtel normal schools for the education of teachers are attached to the cantonal schools. Separate establishments for this purpose exist in the cantons of Zurich, Bern, Lucerne, Schaffhausen, Solothurn, St Gall, Aargau, Thurgau, Tessin, Vaud, and Valais. Among the more specialized institutions of the preparatory or middle class are the *Technicum*

at Winterthur, the veterinary colleges at Zurich and Bern, the agricultural schools at Oberstrass and Rütli, and the school of dentistry at Geneva. In the four universities of Basel, Bern, Zurich, and Geneva, each with faculties of law, theology, medicine, and arts (philosophy), the average number of matriculated students per session of six months was, between 1876 (the first year of the Geneva university) and 1881, in theology 113, in law 188, in medicine 469, and in arts 288,—a total of 1058, to which must be added 334 non matriculated. Basel has a preponderance in theology, Bern in law, Zurich in arts. The great federal polytechnicum at Zurich (opened in 1855) comprises schools of architecture, civil and industrial engineering, industrial chemistry, forestry, and agriculture.¹

The public libraries of Switzerland are briefly described in vol. *Libraries* xiv p 528, as they existed in 1868 (cf p 548), for the learned societies, see *SOCIETIES*.

The total revenue of the Confederation, which was only 22,049,353 francs in 1869, had increased to 44,308,000 on an average in 1879–1883, and reached 48,892,000 in 1885, the expenditure, which was 21,744,459 at the first date, had correspondingly increased to 43,312,510 in 1879–1883, and 46,278,685 in 1885.

In Switzerland there is no standing army, but every male citizen between twenty four and forty four years of age is bound to military service and drill. The federal forces consist of the *Auszug*, *Elite*, or regular army (men from twenty to thirty two years old), and the *Landwehr* (men thirty two to forty four years). The whole army was reorganized in 1874, when extensive functions were assigned to the military physician in connexion with the recruiting and calling out of the soldiers. In the ten years 1875–84 there was one new recruit for 111 of the population (foreigners excepted), 49 per cent of the total were declared fit for service, 19 per cent. remained, and 32 per cent. declared unfit. In the long run, about 61.1 per cent. of the young men of the country passed the standard. In 1886 the regulars numbered 117,179 and the *Landwehr* 84,046.²

Railway construction, which began in 1844, proceeded in earnest after the new legislation of 1852, and by the close of 1862 718 miles had been constructed, by 1872 the ordinary lines reached a total of 1458 miles, with 5 miles of special lines, for 1882 the corresponding figures were 2667 and 81. The annual railway profits increased from 105,599,970 francs in 1870–74 to 179,151,112 in 1880–84. Tramways began to be laid down in 1862, and rope railways in 1877. The railways are mostly in the northern plateau and connect with the systems of Northern Europe. The only Swiss line which crosses to the south of the Alps is the St Gotthard (see *RAILWAYS*). The proposed Simplon railway has already been carried up the Rhone valley as far as Brieg. The mountainous character of the country and the special exigencies of its traffic have successfully stimulated to some striking efforts of railway engineering. Thus the Rigi railway rises from the Lake of Lucerne to a height of 5739 feet, with a maximum gradient of 250 per thousand, that of the Rorschach Heiden line is 50 per thousand.

Switzerland is famous for its well made and well kept carriage roads. Some of these that traverse the mountain passes have been constructed at great expense. One of the most remarkable is the mule path down an almost perpendicular rock from the Gemmi Pass to Lenkerbad, made in 1737–40.

Bern has been the seat of the international Postal Union since Post-1874 (see *POST OFFICE*, vol. xix p 584). The federalization of office the national post office dates from 1848,—the different cantons having previously conducted their postal business according to very different methods. It is to be noted that this department charges itself with the conveyance of passengers as well as mails,—these numbering 831,839 in 1880 and 754,385 in 1885. For other details see the table given in vol. xiv p 585.

The length of telegraph lines increased from 1920 kilometres in Tele-1852 to 6874 in 1884 (wires from 1920 to 16,618 kilometres), and graphs the number of despatches from 2876 in 1852 to 1,127,911 in 1884, the total receipts for the latter year being 2,555,687 francs.

In Switzerland there are thirty three legalized banks of issue, Banks their average circulation of notes in 1885 was to the value of 123,431,000 francs. There are 325 savings banks proper (deposits 246,359,735 francs in 1882) and 162 other institutions which receive deposits (267,298,548 francs in 1882). Most of these are in the hands of companies or private merchants.

Besides the older but valuable works of Fabor (1756), Füssli (1765–69), Hüfner (1770–72), Normann (1795–98), Darand (1795–96), Meister (1796), see *Hist. geogr. statistische Gemälde der Schweiz* (a series of monographs, published by Huber and Co. of St Gall and Bern) Holtinger, *Staatshaushalt der Schweiz*, Eltgen, 1847. Franzini, *Stat. della Svizzera*, Lugano, 1837 and 1847–49. Wirth, *Allge. meiste Beschreibung der Schweiz*, Leipzig and Vogt *La Suisse*. Prof Egli's mostkunde 1875 and Farrer's comprehensive *Volksbuch Schweiz*. Berlepsch, *Schweizer Bureau* was founded in 1860 a statistical society in 1864. Dr Kummer gives a history of Swiss statistics in *Zeitschrift für Schweiz. Stat.*, 1885 and his successor engaged on a statistical handbook.

PART II — HISTORY

The Swiss Confederation is made up of twenty-two small states, differing from each other in nearly every point,—religious, political, social, industrial, physical, and linguistic, yet it forms a nation the patriotism of whose members is universally acknowledged. History alone can supply us with the key to this puzzle, but Swiss history, while thus essential if we would thoroughly grasp the nature of the Confederation, is very intricate and very local. A firm hold on a few guiding principles is therefore most desirable, and of these there are three which we must always bear in mind. (1) The first to be mentioned is the *connexion of Swiss history with that of the empire*. Swiss history is largely the history of the drawing together of bits of each of the imperial kingdoms (Germany, Italy, and Burgundy) for common defence against a common foe—the Hapsburgs, and, when this family have secured to themselves the permanent possession of the empire, the Swiss League little by little wins its independence of the empire, practically in 1499, formally in 1648. Originally a member of the empire, the Confederation becomes first an ally, then merely a friend. (2) The second is the *German origin and nature of the Confederation*. Round a German nucleus (the three Forest districts) there gradually gather other German districts—the Confederation is exclusively German, and it is not till 1803 and 1815 that its French- and Italian-speaking “subjects” are raised to political equality with their former masters, and that the Romansch-speaking Leagues of Rhétia (Graubünden) pass from the status of an ally to that of a member of the Confederation. Even now, though by the constitution three languages (German, French, and Italian) are recognized as official, the overwhelming majority of the population of the Confederation is German-speaking (2,030,792 out of 2,846,102 in 1880), and the capital was fixed at Bern by a law of 1848, having previously shifted between various German-speaking towns, while in olden days the diet always met in some German-speaking place. (3) Swiss history is a *study in federalism*. Based on the defensive alliances of 1291 and 1315 made between the three Forest districts, the Confederation is enlarged by the admission of other districts and towns, all leagued with the original three members, but not necessarily with each other. Hence great difficulties are encountered in looking after common interests, in maintaining any real union, the diet was merely an assembly of ambassadors with powers very strictly limited by their instructions, and there was no central executive authority. The Confederation is a *Staatenbund*, or permanent alliance of several small states. After the break-up of the old system in 1798 we see the idea of a *Bundesstaat*, or an organized state with a central legislative, executive, and judiciary, work its way to the front, an idea which is gradually realized in the constitutions of 1848 and 1874. The whole constitutional history of the Confederation is summed up in this transition to a federal state, which, while a single state in its relations with all foreign powers, in home matters carefully maintains the more or less absolute independence of its several members.

Swiss history falls naturally into five great divisions. I the origin of the Confederation—up to 1291¹, II the shaking off dependence on the Hapsburgs—up to 1394 (1474), III the shaking off dependence on the empire—up to 1499 (1648), IV the period of religious divisions and French influence—up to 1814, V the construction of an independent state as embodied in the constitutions of 1848 and 1874.

I On August 1, 1291, the men of the valley of Uri (“homines vallis Uraie”), the free community of the valley

of Schwyz (“universitas vallis de Switz”), and the association of the men of the lower valley of Nidwald (“communitas hominum intramontanorum vallis inferioris”) formed an Everlasting League for the purpose of self defence against all who should attack or trouble them, a league which is expressly stated to be a confirmation of a former one (“antiquam confederationis formam juramento vallatam presentibus innovando”). This League was the foundation of the Swiss Confederation.

What were these districts? and why at this particular moment was it necessary for them to form a defensive league? The legal and political conditions of all differed. (a) In 853 Louis the German granted (*inter alia*) all his lands (and the rights annexed to them) situated in the “pagellus Uroniæ” to the convent of Sts Felix and Regula in Zurich (the present Fraumünster), of which his daughter Hildegard was the first abbess, and gave to this district the privilege of exemption from all jurisdiction save that of the king (*Reichsfreiheit*). The abbey thus became possessed of the greater part of the valley of the Reuss between the present Devil’s Bridge and the Lake of Lucerne, for the upper valley of Urseren belonged at that time to the abbey of Disentis in the Rhine valley, and did not become permanently allied with Uri till 1410. The privileged position of the abbey tenants gradually led the other men of the valley to “commend” themselves to the abbey, whether they were tenants of other lords, or free men as in the Schächenthal. The meeting of all the inhabitants of the valley, for purposes connected with the customary cultivation of the soil according to fixed rules and methods, served to prepare them for the enjoyment of full political liberty in later days. The important post of “protektor” (*advocatus* or *vogt*) of the abbey was given to one family after another by the emperor as a sign of trust, but, when, on the extinction of the house of Züringen in 1218, the office was granted to the Hapsburgs, the protests of the abbey tenants, who feared the rapidly rising power of that family, and perhaps also the desire of the emperor to obtain command of the St Gotthard pass (of which the first authentic mention occurs about 1236, when of course it could only be traversed on foot), led to the recall of the grant in 1231, the valley being thus restored to its original privileged position, and depending immediately on the emperor. (b) In Schwyz we must distinguish between the districts west and east of Stöcken. In the former the land was in the hands of many nobles, amongst whom were the Hapsburgs, in the latter there was, at the foot of the Mythen, a free community of men governing themselves, and cultivating their land in common, both, however, were politically subject to the emperor’s delegates, the counts of the Zürichgau, who after 1173 were the ever-advancing Hapsburgs. But in 1240 the free community of Schwyz obtained from the emperor Frederick II a charter which removed them from the jurisdiction of the counts, placing them in immediate dependence on the emperor, like the abbey men of Uri. In a few years, however, the Hapsburgs contrived to dispense with this charter in practice. (c) In Unterwalden things were very different. The upper valley (Obwald or Sarnen, so called because of its position with regard to the Kernwald) formed part of the Aargau, the lower (Nidwald or Stanz) part of the Zürichgau, while in both the soil was owned by many ecclesiastical and lay lords, among them being the Hapsburgs and the Alsatian abbey of Murbach. Hence in this district there were no privileged tenants, no free community, no centre of unity, and this explains why Obwald and Nidwald won their way upward so much more slowly than their neighbours in Uri and Schwyz. Thus the early history and legal position of these three districts was very far from being the same.

¹ For the legendary origin, see Trill.

The
League
of 1291

In Uri the Hapsburgs, save for a brief space, had absolutely no rights, while in Schwyz, Obwald, and Nidwald they were also, as counts of the Zurichgau and of the Aargau, the representatives of the emperor.

The Hapsburgs had been steadily rising for many years from the position of an unimportant family in the Aargau to that of a powerful clan of large landed proprietors in Swabia and Alsace, and had attained a certain political importance as counts of the Zurichgau and Aargau. In one or both qualities the cadet or Lauffenburg line, to which the family estates in the Forest districts round the Lake of Lucerne had fallen on the division of the inheritance in 1232, seem to have exercised their legal rights in a harsh manner. In 1240 the free men of Schwyz obtained protection from the emperor, in 1244 the Hapsburgs built the castle of New Hapsburg on a promontory jutting out into the lake not far from Lucerne, with the object of enforcing their real or pretended rights. It is therefore not a matter for surprise that, when, after the excommunication and deposition of Frederick II by Innocent IV at the council of Lyons in 1245, the head of the cadet line of Hapsburg sided with the pope, the men of the Forest districts should rally round the emperor. Schwyz joined Sarnen, Nidwald helped Lucerne, the castle of New Hapsburg was reduced to its present ruined state, and in 1248 the men of Schwyz, Sarnen, and Lucerne were threatened by the pope with excommunication if they persisted in upholding the emperor and defying their hereditary lords the counts of Hapsburg. The rapid decline of Frederick's cause soon enabled the Hapsburgs to regain their authority in these districts. Yet these obscure risings have a double historical interest, for they are the foundation in fact (so far as they have any) of the legendary stories of Hapsburg oppression told of and by a later age, and these fleeting alliances are doubtless what is represented by the "*antiqua confederatio*" of 1291, Schwyz already taking the lead, while Uri, secure in its privileged position, contented itself with giving a moral support to its neighbours. After this temporary check the power of the Hapsburgs continued to increase rapidly. In 1273 the head of the cadet line sold all his lands and rights in the Forest districts to the head of the elder or Alsatian line, Rudolph, who a few months later was elected to the imperial throne, in virtue of which he acquired for his family in 1282 the duchy of Austria, which now for the first time became connected with the Hapsburgs. Rudolph recognized the privileges of Uri but not those of Schwyz, and, as he now united in his own person the characters of emperor, count of the Zurichgau and of the Aargau, and landowner in the Forest districts (a name occurring first in 1289), such a union of offices might be expected to result in a confusion of rights. On April 16, 1291, Rudolph bought from the abbey of Murbach in Alsace (of which he was "advocate") all its rights over the town of Lucerne and the abbey estates in Unterwalden. It thus seemed probable that the other Forest districts would be shut off from their natural means of communication with the outer world by way of the lake. Rudolph's death, on July 15 of the same year, cleared the way, and a fortnight later (August 1) the Everlasting League was made between the men of Uri, Schwyz, and Nidwald (the words "*et vallis superioris*," i.e., Obwald, were inserted later on the original seal of Nidwald) for the purpose of self-defence against a common foe. We do not know the names of the delegates of each valley who concluded the treaty, nor the place where it was made, nor have we any account of the deliberations of which it was the result. The common seal—that great outward sign of the right of a corporate body to act in its own name without needing to ask the permission of any external authority—appears first in Uri in 1243,

in Schwyz in 1281, in Nidwald not till this very document of 1291, yet, despite the great differences in their political status, they all joined in concluding this League, and confirmed it by their separate seals, thereby laying claim on behalf of their union to an independent existence. Besides promises of aid and assistance in the case of attack, they agree to punish great criminals by their own authority, but advise that, in minor cases and in all civil cases, each man should recognize the "*judex*" to whom he owes suit, engaging that the confederates will, in case of need, enforce the decisions of the "*judex*." At the same time they unanimously refuse to recognize any "*judex*" who has bought his charge or is a stranger to the valleys. All disputes between the parties to the treaty are, as far as possible, to be settled by a reference to arbiters, a principle which remained in force for over six hundred years. "*Judex*" is a general term for any local official, especially the chief of the community, whether named by the lord or by the community, and, as earlier in the same year Rudolph had promised the men of Schwyz not to force upon them a "*judex*" belonging to the class of serfs, we may conjecture from this very decided protest that the chief source of disagreement was in the matter of the jurisdictions of the lord and the free community, and that some recent event in Schwyz led it to insist on the insertion of this provision. It is stipulated also that every man shall be bound to obey his own lord "*convenienter*," or so far as is fitting and right.

II. In the struggle for the empire, which extended over the years following the conclusion of the League of 1291, we find that the Confederates support without exception the anti-Hapsburg candidate. On October 16, 1291, Uri and Schwyz ally themselves with Zurich, and join the general rising in Swabia against Albert, the new head of the house of Hapsburg. It soon failed, but hopes revived when in 1292 Adolf of Nassau was chosen emperor. In 1297 he confirmed to the free men of Schwyz their charter of 1240, and, strangely enough, confirmed the same charter to Uri, instead of their own of 1231. It is in his reign that we have the first recorded meeting of the "*landsgemeinde*" (or assembly) of Schwyz (1294), that of Uri being heard of as early as 1275. But in 1298 Albert of Hapsburg himself was elected to the empire. His rule was strict and severe, though not oppressive. He did not indeed confirm the charters of Uri or of Schwyz, but he did not attack the ancient rights of the former, and in the latter he exercised his rights as a landowner and did not abuse his political rights as emperor or as count. In Unterwalden we find that in 1304 the two valleys were joined together under a common administrator, a great step forwards to permanent union. The stories of Albert's tyrannical actions in the Forest districts are not heard of till two centuries later, though no doubt the union of offices in his person was a permanent source of alarm to the Confederation. It was in his time too that the "*terrier*" (or list of manors and estates, with enumeration of all quit rents, dues, &c., payable by the tenants to their lords) of all the Hapsburg possessions in Upper Germany was begun, and it was on the point of being extended to Schwyz and Unterwalden when Albert was murdered (1308) and the election of Henry of Luxemburg roused the free men to resist the officials charged with the survey. Despite his promise to restore to the Hapsburgs all rights enjoyed by them under his three predecessors (or maintain them in possession), Henry confirmed, on June 3, 1309, to Uri and Schwyz their charters of 1297, and, for some unknown reason, predecessor, though as a matter of fact none had been granted. This charter, and the nomination of one imperial bailiff to administer the three districts, had the

effect of placing them all (despite historical differences) in an identical political position, and that the most privileged yet given to any of them,—the freedom of the free community of Schwyz. A few days later the Confederates made a fresh treaty of alliance with Zurich, and in 1310 the emperor placed certain other inhabitants of Schwyz on the same privileged footing as the free community. The Hapsburgs were put off with promises, and, though their request (1311) for an inquiry into their precise rights in Alsace and in the Forest districts was granted, no steps were taken to carry out this investigation. Thus in Henry's time the struggle was between the empire and the Hapsburgs as to the recognition of the rights of the latter, *not* between the Hapsburgs and those dependent on them as landlords or counts.

On Henry's death in 1313 the electors hesitated long between Frederick the Handsome of Hapsburg and Louis of Bavaria. The men of Schwyz seized this opportunity for making a wanton attack on the great abbey of Einsiedeln, with which they had a long-standing quarrel as to rights of pasture. The abbot caused them to be excommunicated, and Frederick (the choice of the minority of the electors), who was the hereditary "advocate" of the abbey, placed them under the ban of the empire. Louis, to whom they appealed, removed the ban, on which Frederick issued a decree by which he restored to his family all their rights and possessions in the three valleys and Urseren, and charged his brother Leopold with the execution of this order. The Confederates hastily concluded alliances with Glarus, Urseren, Aargau, and Interlaken to protect themselves from attack on every side. Leopold collected a brilliant army at the Austrian town of Zug in order to attack Schwyz, while a body of troops was to take Unterwalden in the rear by way of the Brünig pass. On November 15, 1315, Leopold, with from 15,000 to 20,000 men, moved forward along the shore of the Lake of Egeri, intending to assail the village of Schwyz by climbing the steep hillside above the southern end of the lake, through the narrow pass of Morgarten between the mountain and the lake. At the summit of the pass waited the valiant band of the Confederates, from 1300 to 1500 strong. The march up the rugged and slippery slope threw the Austrian army into disarray, which became a rout and mad flight when huge boulders and trunks of trees were hurled from above by their foes, who charged down on them, and drove them into the lake. No fewer than 1500 Austrians fell, their brilliant cavalry had completely failed before the onset of the lightly armed Swiss footmen. Leopold fled in hot haste to Winterthur, and the attack by the Brünig was driven back by the men of Unterwalden. On December 9, 1315, representatives of the victorious highlanders met at Brunnen, on the Lake of Lucerne, not far from Schwyz, and renewed the Everlasting League of 1291. In their main lines the two documents are very similar, the later being chiefly an expansion of the earlier. That of 1315 is in German (in contrast to the 1291 League, which is in Latin), and has one or two striking clauses largely indebted to a decree issued by Zurich on July 24, 1291. None of the three districts or their dependents is to recognize a new lord without the consent and counsel of the rest (this is probably meant to provide for an interregnum in or disputed election to the empire, possibly for the chance of the election of a Hapsburg), strict obedience in all lawful matters is to be rendered to the rightful lord in each case, unless he attacks or wrongs any of the Confederates, in which case they are to be free from all obligations, no negotiations, so long as the "Lander" have no lord, are to be entered on with outside powers, save by common agreement of all. Louis solemnly recog-

nized and confirmed the new League in 1316, and in 1318 a truce was concluded between the Confederates and the Hapsburgs, who treat with them on equal terms. The lands and rights annexed belonging to the Hapsburgs in the Forest districts are fully recognized as they existed in the days of Henry of Luxemburg, and freedom of commerce is granted. But there is not one word about the political rights of the Hapsburgs as counts of the Zurichgau and Aargau. This distinction gives the key to the whole history of the relations between the Confederates and Hapsburgs, the rights of the latter as landowners are fully allowed, and till 1801 they possessed estates within the Confederation, it is their political rights which are always contested by the Swiss, who desire to rule themselves, free from the meddling of any external power.

As early as 1320 we find the name "Swiss" (derived from Schwyz, which had always been the leader in the struggle) applied to the Confederation as a whole, though it was not till after Sempach (1386) that it came into popular use, and it did not form the official name of the Confederation till 1803. This is in itself a proof of the great renown which the League won by its victory at Morgarten. Another is that as years go by we find other members admitted to the privileges of the original alliance of the three Forest districts. First to join the League (1332) was the neighbouring town of Lucerne, which had grown up round the monastery of St. Leodegar (whence the place took its name), perhaps a colony, certainly a cell of the great house of Murbach in Alsace, under the rule of which the town remained till its sale in 1291 to the Hapsburgs. This act of Lucerne was opposed by the house of Austria, but, despite the decision of certain chosen arbitrators in favour of the Hapsburg claims, the town clung to the League with which it was connected by its natural position, and thus brought a new element into the pastoral association of the Forest districts, which now surrounded the entire Lake of Lucerne. Next, in 1351, came the ancient city of Zurich, which in 1218, on the extinction of the house of Zaringen, had become a free imperial city in which the abbess of the Fraumünster (the lady of Uri) had great influence, though from 1240 the citizens elected the council which she had previously named. In 1336 there had been a great civic revolution, headed by Rudolph Brun, which had raised the members of the craft guilds to a position in the municipal government of equal power with that of the patricians, who, however, did not cease intriguing to regain their lost privileges, so that Brun, after long hesitation, decided to throw in the lot of the city with the League rather than with Austria. In this way the League now advanced from the hilly country to the plains, though the terms of the treaty with Zurich did not bind it so closely to the Confederates as in the other cases (the right of making alliances apart from the League being reserved, though the League was to rank before these), and hence rendered it possible for Zurich now and again to incline towards Austria in a fashion which did great hurt to its allies. In 1352 the League was enlarged by the admission of Glarus and Zug. Glarus belonged to the monastery of Säckingen on the Rhine (founded by the Irish monk Fridolin), of which the Hapsburgs were "advocates," claiming therefore many rights over the valley, which refused to admit them, and joyfully received the Confederates who came to its aid, but it was placed on a lower footing than the other members of the League, being bound to obey their orders. Three weeks later the town and district of Zug, attacked by the League and abandoned by their Hapsburg masters, joined the Confederation, forming a transition link between the civic and rural members of the League. The immediate occasion of the union of these two districts was the war begun by the

The
Leads
of ei
me

Austrian duke against Zurich, which was ended by the Brandenburg peace of 1352, by which Glarus and Zug were to be restored to the Hapsburgs, who also regained their rights over Lucerne, Zug was won for good by a bold stroke of the men of Schwyz in 1364, but it was not till the day of Nafels (1388) that Glarus recovered its lost freedom. These temporary losses and the treaty made by Brnu of Zurich with Austria in 1356 were, however, far outweighed by the entrance into the League in 1353 of the famous town of Bern, which, founded in 1191 by Berthold V of Zaringen, and endowed with great privileges, had become a free imperial city in 1218 on the extinction of the Zaringen dynasty. Founded for the purpose of bridling the turbulent feudal nobles around, many of whom had become citizens, Bern beat them back at Dornbühl (1298), and made a treaty with the Forest districts as early as 1323. In 1339, at the bloody fight of Laupen, she had broken the power of the nobles for ever, and in 1352 had been forced by a treaty with Austria to take part in the war against Zurich, but soon after the conclusion of peace entered the League as the ally of the three Forest districts, being thus only indirectly joined to Lucerne and Zurich. The special importance of the accession of Bern was that the League now began to spread to the west, and was thus brought into connexion for the first time with the French speaking land of Savoy. The League thus numbered eight members, the fruits of Morgarten, and no further members were admitted till 1481, after the Burgundian war. But, in order to thoroughly understand the nature of the League, it must be remembered that, while each of the five new members was allied with the original nucleus,—the three Forest districts,—these five were not directly allied to one another. Lucerne was allied with Zurich and Zug, Zurich with Lucerne, Zug, and Glarus, Glarus with Zurich, Zug with Lucerne and Zurich, Bern with no one except the three original members. The circumstances under which each entered the League can alone explain the very intricate relations at this time of its eight members.

Sempach.

After a short interval of peace the quarrels with Austria broke out afresh, all the members of the League, save the three Forest districts and Glarus, joined the great union of the South German cities, but their attention was soon called to events nearer home. Lucerne fretted much under the Austrian rule, received many Austrian subjects among her citizens, and refused to pay custom duties to the Austrian bailiff at Rothenburg, on the ground that she had the right of free traffic. An attack on the custom house at Rothenburg, and the gift of the privileges of burghership to the discontented inhabitants of the little town of Sempach a short way off, so irritated Leopold III (who then held all the possessions of his house outside Austria) that, unmindful of the defeat of his uncle at Morgarten in 1315, he collected a great army, with the intention of crushing his rebellious town. Lucerne meanwhile had summoned the other members of the League to her aid, and, though Leopold's feint of attacking Zurich caused the troops of the League to march at first in that direction, they discovered their mistake in time to turn back and check his advance on Lucerne. From 1500 to 1600 men of Uri, Schwyz, Unterwalden, and Lucerne opposed the 6000 which made up the Austrian army. The decisive fight took place on July 9, 1386, near Sempach, on a bit of sloping meadow-land, cut up by streams and hedges, which forced the Austrian knights to dismount. The great heat of the day, which rendered it impossible to fight in armour, and the furious attacks of the Confederates, finally broke the Austrian line after more than one repulse and turned the day (see WINKELRIED) Leopold, with a large number of his followers, was slain,

and the Hapsburg power within the borders of the Confederation finally broken. Glarus at once rose in arms against Austria, but it was not till the expiration of the truce made after Sempach that Leopold's brother, Albert of Austria, brought an army against Glarus, and was signally defeated at Nafels (not far from Glarus) on April 9, 1388, by a handful of Glarus and Schwyz men, the troops of the other Confederates arriving too late.

In 1389 a peace for seven years was made, the Confederates being secured in all their conquests, an attempt made in 1393 by Austria by means of Schono, the chief magistrate of Zurich and leader of the patrician party, to stir up a fresh attack failed owing to a rising of the burghers, who sympathized with the Confederates, and on July 16, 1394, the peace was prolonged for twenty years (and again in 1412 for fifty years), various stipulations being made by which the hundred years' struggle of the League to throw off all political dependence on the Hapsburgs was finally crowned with success. Glarus was freed on payment of 200 pounds annually (in 1389-1395 it bought up all the rights of Säckingen), Zug too was released from Austrian rule. Schwyz was given the town of Einsiedeln (the "advocatia" of the great abbey following in 1397), Lucerne got the Entlibuch, Sempach, and Rothenburg, the last-named being mortgaged only, Bern and Solothurn were confirmed in their conquests. Above all, the Confederation as a whole was relieved from the overlordship of the Hapsburgs, to whom, however, all their rights and dues as landed proprietors were expressly reserved,—Bern, Zurich, and Solothurn guaranteeing the maintenance of these rights and dues, with power in case of need to call on the other Confederates to support them by arms. Thus the distinction always made by the Confederates between the Hapsburgs as rulers and as landowners was once more upheld, and, though that powerful family entertained hopes of recovering its former rights, so that technically the treaties of 1389, 1394, and 1412 were but truces, it finally and for ever renounced all its feudal rights and privileges within the Confederation by the "Everlasting Compact" of 1474.

It is probable that Bern did not take any active share in the Sempach war because she was bound by the treaty of peace made with the Austrians in 1368, and Solothurn, allied with Bern, was doubtless a party to the treaty of 1394 (though not yet in the League), because of its sufferings in 1382 at the hands of the Kyburg line of the Hapsburgs, whose possessions (Thun, Burgdorf, &c.) in 1384 fell into the hands of the two allies.

We may mention here the foray (known as the English or Gugler war) made in 1374-75 by Enguerrand de Coucy (husband of Isabella, daughter of Edward III of England) and his freebooters (many of them Englishmen and Welshmen), called "Gugler" from their pointed steel caps, with the object of obtaining possession of certain towns in the Aargau (including Sempach), which he claimed as the dowry of his mother Catherine, daughter of the Leopold who was defeated at Morgarten. He was put to rout in the Entlibuch by the men of Bern, Freiburg, Schwyz, and Unterwalden in December 1375. This victory, which gave rise to the first great Swiss war song, was commemorated with great rejoicings as lately as 1875.

III. The great victory at Sempach not merely vastly increased the fame of the Everlasting League but also enabled it to extend both its influence and its territory. The 15th century is the period when both the League and its several members took the aggressive, and the expansion of their power and lands cannot be better seen than by comparing the state of things at the beginning and at the end of this century. The pastoral highlands of Appenzell (Abbatia Cella) and the town of St Gall had

Freedom from the political claims of the Hapsburgs

in Appenzell, St Gall, and Valais.

long been trying to throw off the rights exercised over them by the great abbey of St Gall, founded in the 7th century by the Irish monk of that name. The Appenzellers in particular had offered a stubborn resistance, and the abbot's troops had been beaten back by them in 1403 on the heights of Vogelnseck, and again in 1405 in the great fight on the pass of the Stoss¹ (which led up into the highlands), in which the abbot was backed by the duke of Austria. Schwyz had given them some help, and in 1411 Appenzell was placed under the protection of the League (save Bern), with which in the next year the city of St Gall made a similar treaty to last ten years. So too in 1416-17 several of the "tithings" of the Upper Wallis or Valais (i.e., the upper stretch of the Rhone valley), which in 1388 had beaten the bishop and the nobles in a great fight at Visp, became closely associated with Lucerne, Uri, and Unterwalden. It required aid in its final struggle against the great house of Raron, the count-bishop of Sitten (or Sion), and the house of Savoy, which held Lower Wallis,—the Forest districts, on the other hand, wishing to secure themselves against Raron and Savoy in their attempt to permanently conquer the Val d'Ossola on the south side of the Simplon pass. Bern, however, supported its burglier, the lord of Raron, but, by a peace made in 1420, the powers of the bishop and the lord of Raron were greatly diminished, the latter house soon after sold all its lands and rights, and migrated to the district of Toggenburg. Such were the first links which bound these lands with the League, but they did not become full members for a long time—Appenzell in 1513, St Gall in 1803, Wallis in 1815.

Space will not allow us to enumerate all the small conquests made in the first half of the 15th century by every member of the League, suffice it to say that each increased and rounded off its territory, but did not give the conquered lands any political rights, governing them as "subject lands," often very harshly. The same phenomenon of lands which had won their own freedom playing the part of tyrant over other lands which joined them more or less by their voluntary action is seen on a larger scale in the case of the conquest of the Aargau, and in the first attempts to secure a footing south of the Alps.

In 1412 the treaty of 1394 between the League and the Hapsburgs had been renewed for fifty years, but when in 1415 Duke Frederick of Austria helped Pope John XXII to escape from Constance, where the great council was then sitting, and the emperor Sigismund placed the duke under the ban of the empire, summoning all members of the empire to arm against him, the League hesitated, because of their treaty of 1412, till the emperor declared that all the rights and lands of Austria in the League were forfeited, and that their compact did not release them from their obligations to the empire. In the name, therefore, of the emperor, and by his special command, the different members of the League overran the extensive Hapsburg possessions in the Aargau. The chief share fell to Bern, but certain districts (known as the *Freie Aemter*) were joined together and governed as bailiwicks held in common by all the members of the League (save Uri, busied in the south, and Bern, who had already secured the lion's share of the spoil for herself). This is the first case in which the League as a whole took up the position of rulers over districts which, though guaranteed in the enjoyment of their old rights, were nevertheless politically unfree. As an encouragement and a reward, Sigismund had granted

in advance to the League the right of criminal jurisdiction ("haute justice" or "Blutbann"), which points to the fact that they were soon to become independent of the empire, as they were of Austria. But all through the 15th century it must be carefully borne in mind that the members of the League were constantly recognized as and acknowledged themselves to be members of the empire.

As the natural policy of Bern was to seek to enlarge ^{Franco-Italian} its borders at the expense of Austria, and later of Savoy, so we find that Uri, shut off by physical causes from extension in other directions, as steadily turned its eyes towards the south. In 1410 the valley of Urseren was finally joined to Uri, though communications were difficult, and carried on only by means of the "stiebende Brücke," a wooden bridge suspended by chains over the Reuss, along the side of a great rocky buttress (pierced in 1707 by the tunnel known as the Urnerloch), yet this enlargement of the territory of Uri gave it complete command over the St Gotthard pass, long commercially important, and now to serve for purposes of war and conquest. Already in 1403 Uri and Obwald had taken advantage of a quarrel with the duke of Milan as to custom dues at the market of Varese to occupy the long narrow valley on the south of the pass called the Val Leventina, in 1410 the men of the same two lands, exasperated by the insults of the local lords, called on the other members of the League, and all jointly (except Bern) occupied the Val d'Ossola, on the south side of the Simplon pass. But in 1414 they lost this to Savoy, and, with the object of getting it back, obtained in 1416-17 the alliance of the men of Upper Wallis, then fighting for freedom, and thus regained the valley, despite the exertions of the great Milanese general Carmagnola. In 1419 Uri and Obwald bought from its lord the town and district of Bellinzona. This rapid advance, however, did not approve itself to the duke of Milan, and Carmagnola reoccupied both valleys, the Confederates were not at one with regard to these southern conquests, a small body pressed on in front of the rest, but was cut to pieces at Arbedo near Bellinzona in 1422. A bold attempt in 1425 by a Schwyzer, Peter Rissi by name, to recover the Val d'Ossola caused the Confederates to send a force to rescue these adventurers, but the duke of Milan intrigued with the divided Confederates, and finally in 1426, by a payment of a large sum of money and the grant of certain commercial privileges, the Val Leventina, the Val d'Ossola, and Bellinzona were restored to him. Thus the first attempt of Uri to acquire a footing south of the Alps had failed, but the wish to recover its lost conquests still continued, and a later attempt was more successful, leading to the inclusion in the Confederation of what has been called "Italian Switzerland."

The original contrasts between the social condition of the different members of the League became more marked when the period of conquest began, and led to quarrels and ill feeling in the matter of the Aargau and the Italian conquests which a few years later ripened into a civil war, brought about by the dispute as to the succession to the lands of Frederick, count of Toggenburg, the last male representative of his house. Count Frederick's predecessors had greatly extended their domains, so that they took in not only the Toggenburg or upper valley of the Thur, but Uznach, Sargans, the Rhine valley between Feldkirch and Sargans, the Prattigau, and the Daves valley. He himself, the last great feudal lord on the left bank of the Rhine, had managed to secure his vast possessions by making treaties with several members of the League, particularly Zurich (1402) and Schwyz (1417),—from 1428 inclining more and more to Schwyz (then ruled by Ital Reding), being disgusted with the arrogant behaviour of Stüssi, the burgomaster of Zurich. His

¹ The tales of the heroic defence of Uli Rottach of Appenzell, and of the appearance of a company of Appenzell women disguised as warriors which turned the battle, are told in connexion with this fight, but do not appear till the 17th and 18th centuries, being thus quite unhistorical, so far as our genuine evidence goes.

death (April 30, 1436) was the signal for the breaking out of strife. The Prättigan and Davos valley formed the League of the Ten Jurisdictions in Rhaetia (see below), while Frederick's widow sided with Zurich against Schwyz for different portions of the great inheritance which had been promised them. After being twice defeated, Zurich was forced in 1440 to buy peace by certain cessions (the Upper March) to Schwyz, the general feeling of the Confederates being opposed to Zurich, several of them going so far as to send men and arms to Schwyz. Zurich, however, was bitterly disappointed at these defeats, and had recourse to that policy which she had adopted in 1356 and 1393—an alliance with Austria (concluded in 1442), which now held the imperial throne in the person of Frederick III. Though technically within her rights according to the terms on which she had joined the League in 1351, this act of Zurich caused the greatest irritation in the Confederation, and civil war at once broke out, especially when the Hapsburg emperor had been solemnly received and acknowledged in Zurich. In 1443 the Zurich troops were completely defeated at St Jakob on the Sihl, close under the walls of the city, Stüssi himself being slain. Next year the city itself was long besieged. Frederick, unable to get help elsewhere, procured from Charles VII of France the despatch of a body of Armagnac free lances (the Écorcheurs), who came, 30,000 strong, under the dauphin Louis, plundering and harrying the land, till, at the very gates of the free imperial city of Basel (which had made a twenty years' alliance with Bern), by the leper house of St Jakob on the Birs (August 26, 1444), the desperate resistance of a small body of Confederates (1200 to 1500) till cut to pieces, checked the advance of the freebooters, who sustained such tremendous losses that, though the victors, they hastily made peace, and returned whence they had come. Several small engagements ensued, Zurich long declining to make peace because the Confederates required, as the result of a solemn arbitration, the abandonment of the Austrian alliance. At length it was concluded in 1450, the Confederates restoring almost all the lands they had won from Zurich. Thus ended the third attempt of Austria to conquer the League by means of Zurich, which used its position as an imperial free city greatly to the harm of the League, and was the cause of the first civil war which distracted the League.

These fresh proofs of the valour of the Confederates, and of the growing importance of the League, did not fail to produce important results. In 1452 the "Confederates of the Old League of Upper Germany" (as they styled themselves) made their first treaty of alliance with France, a connexion which was destined to exercise so much influence on their history. Round the League there began to gather a new class of allies (known as "Zugewandte Orte," or associated districts), more closely joined to it, or to certain members of it, than by a mere treaty of friendship, yet not being admitted to the rank of a full member of the League. Of these associates three, the abbot (1451) and town of St Gall (1454), and the town of Bienne (Biel), through its alliance (1352) with Bern, were given seats and votes in the diet, being called "socii," while others, known as "confederati," were not so closely bound to the League, such as Wallis (1416-17), Schaffhausen (1454), Mühlhausen (1466), Rothweil (1463).¹ Appenzell, too, in 1452, rose from the rank of a "protected district" into the class of associates, outside which were certain places "protected" by several members of the League, such as Gersau (1359), the abbey of Engelberg (c 1421) and Einsiedeln (1397-1434), and the town of

Rapperschwyl (1458). The relation of the "associates" to the League may be compared with the ancient practice of "commendation" they were bound to obey orders in the matter of declaring war, making alliances, &c.

In 1439 Sigismund succeeded his father Frederick in the Hapsburg lands in Alsace, the Thurgau, and Tyrol, and, being much irritated by the constant encroachments of the Confederates, in particular by the loss of Rapperschwyl (1458), declared war against them, but fared very badly. In 1460 the Confederates overran the Thurgau, and occupied Sargans. Winterthur was only saved by an heroic defence. Hence in 1461 Sigismund had to give up his claims on those lands and renew the peace for fifteen years, while in 1467 he sold Winterthur to Zurich. Thus the whole line of the Rhine was lost to the Hapsburgs, who retained (till 1802) in the territories of the Confederates the Frickthal only. The Thurgovian bailiwicks were governed in common as "subject" lands by all the Confederates except Bern. The touchiness of the now rapidly advancing League was shown by the eagerness with which in 1468 its members took up arms against certain small fencible nobles who were carrying on a harassing guerilla warfare with their allies Schaffhausen and Mühlhausen. They laid siege to Waldshut, and to buy them off Sigismund in August 1468 engaged to pay 10,000 gulden as damages by June 24, 1469, in default of payment the Confederates were to keep for ever the Black Forest, Waldshut, and certain other Black Forest towns on the Rhine. A short time before (1467) the League had made treaties of friendship with Philip the Good, duke of Burgundy, and with the duke of Milan. All was now prepared for the intricate series of intrigues which led up to the Burgundian War,—a great epoch in the history of the League, as it created a common national feeling, enormously raised its military reputation, and brought about the close connexion with certain parts of Savoy which finally (1803-15) were admitted into the League.

Sigismund did not know where to obtain the sum he had promised to pay. In this strait he turned to Charles the Bold (properly the Rash), duke of Burgundy, who was then beginning his wonderful career, and aiming at restoring the kingdom of Burgundy. For this purpose Charles wished to marry his daughter and heiress to Maximilian, son of the emperor, and first cousin of Sigismund, in order that the emperor might be induced to give him the Burgundian crown. Hence he was ready to meet Sigismund's advances. On May 9, 1469, Charles promised to give Sigismund 50,000 florins, receiving as security for repayment Alsace, the Breisgau, the Sundgau, the Black Forest, and the four Forest towns on the Rhine (Rheinfelden, Säckingen, Lauffenburg, and Waldshut), in addition, Charles took Sigismund under his protection, specially against the Swiss, and agreed to give him aid in a war if he was attacked by them. It was not unnatural for Sigismund to think of attacking the League, but Charles's engagement to him is quite inconsistent with the friendly agreement made between Burgundy and the League as late as 1467. The emperor then on his side annulled Sigismund's treaty of 1468 with the Swiss, and placed them under the ban of the empire. Charles committed the mortgaged lands to Peter von Hagenbach, who proceeded to try to establish his master's power there by such harsh and severe measures as to cause all the people to murmur, then rise against him.

The Swiss in these circumstances began to look towards Louis XI of France, who had confirmed the treaty of friendship made with them by his father in 1452. Sigismund had applied to him early in 1469 to help him in his many troubles, and to give him aid against the Swiss, but Louis had point-blank refused. Anxious to secure

Consti-
tution
of the
League,
c 1450

¹ To a class of "confederati" belonged in later times Neuchâtel (1475-95), the Leagues of Rhaetia (1497-98), Geneva (1510-36), and the League of Basel (1570).

their neutrality in case of his war with Charles, he made a treaty with them on August 13, 1470, to this effect. All the evidence goes to show that Sigismund was not a tool in the hands of Louis, and that Louis, at least at that time, had no definite intention of involving Charles and the Swiss in a war, but wished only to secure his own flank.

Sigismund in the next few years tried hard to get from Charles the promised aid against the Swiss (the money was paid punctually enough by Charles on his behalf), who put him off with various excuses. Charles on his side in 1471-72 tried to make an alliance with the Swiss, his efforts being supported by a party in Bern headed by Adriaen von Bubenberg. Probably Charles wished to use both Sigismund and the Swiss to further his own interests, but his shifty policy had the effect of alienating both from him. Sigismund, disgusted with Charles, now inclined towards Louis, who calls he formally became in the summer of 1473, — a change which was the real cause of the emperor's flight from Trevis in November 1473, when he had come there expressly to crown Charles. The Confederates on their side were greatly moved by the oppression of their friends and allies in Alsace by Haguenbach, and tried in vain (January 1474) to obtain some redress from his master. Charles's too statesmanlike policy had thus lost him both Sigismund and the Swiss. The Swiss looked upon Louis, who, thoroughly aware of Charles's ambition, and fearing that his disappearance at Trevis would soon lead to open war, aimed at a master stroke — no less than the reconciliation of Sigismund and the Swiss. This on the face of it seemed impracticable, but common need and Louis's dexterous negotiation brought it to pass, so that on March 30, 1474, the Everlasting Compact was signed at Constance, by which Sigismund finally renounced all Austrian claims on the lands of the Confederates, and guaranteed them in quiet enjoyment of them; they, on the other hand, agreed to support him if Charles did not give up the mortgaged lands when the money was paid down. The next day the Swiss joined the league of the Alsatian and Rhine cities, as also did Sigismund. Charles was called on to receive the money contributed by the Alsatian cities, and to restore his lands to Sigismund. He, however, took no steps. Within a week the oppressive bailiff Haguenbach was captured, and a month later (May 9, 1474) he was put to death, Bern alone of the Confederates being represented. On October 9 the emperor, acting of course at the instance of Sigismund, ordered them to declare war against Charles, which took place on October 25, Bern acting in the name of the Confederates, and alleging that they made war solely by order of the emperor and not as principals. Next day Louis formally ratified his alliance with the Confederates, promising money and pensions, the latter to be increased if he did not send men. Throughout these negotiations and later, Bern directs Swiss policy, though all the Confederates are not quite agreed. She was specially exposed to attack from Charles and Charles's ally (since 1468) Savoy, and her best chance of extending her territory lay towards the west and south. A forward policy was thus distinctly the best for Bern, and this was the line supported by the French party under Nicholas von Diesbach, Von Bubenberg opposing it, though not with any idea of handing over Bern to Charles. The Forest districts, however, were very suspicious of this movement to the west, by which Bern alone could profit, though the League as a whole might lose then, too, Uri had in 1440 finally won the Val Leventina, and she and her neighbours favoured a southerly policy — a policy which was crowned with success after the gallant victory won at Giornico in 1478 by a handful

of men from Zurich, Lucerne, Uri, and Schwyz over 12,000 Milanese troops, though the main body of the Confederates was already on its way home. Thus Uri gained for the first time a permanent footing south of the Alps, not long before Bern had won its first conquests from Savoy.

The war in the west was begun by Bern and her allies (Freiburg, Solothurn, &c.) by marauding expeditions across the Jura, in which Héricourt (November 1474) and Blamont (August 1475) were taken, both towns being held of Charles by the "sires" de Neuchâtel, a cadet line of the counts of Montbéliard. It is said that in the former expedition the white cross was borne (for the first time) as the ensign of the Confederates, but not in the other. Meanwhile Yolande, the duchess of Savoy, had, through fear of her brother Louis XI and hatred of Bern, finally joined Charles and Milan (January 1475), the immediate result of which was the capture, by the Bernese and friends (on the way back from a foray on Pontarlier in the Free County of Burgundy or Franche Comté) of several places in Vaud, notably Granson and Echallens, both held of Savoy by a member of the house of Châllon, princes of Orange (April 1475), as well as Orbe and Jougne, held by the same, but under Burgundy. In the summer Bern seized on the Savoyard district of Aigle. Soon after (October–November 1475) the same energetic policy won for her the Savoyard towns of Morat, Aynches, Estavayer, and Yverdon, while (September) the Upper Wallis, which had conquered all Lower or Savoyard Wallis, entered into alliance with Bern for the purpose of opposing Savoy by preventing the arrival of Milanese troops. Alarmed at their success, the emperor and Louis deserted (June–September) the Confederates, who thus, by the influence of Louis and Bernese ambition, saw themselves led on and then abandoned to the wrath of Charles, and very likely to lose their new conquests. They had entered on the war as "helpers" of the emperors, and now became principals in the war against Charles, who raised the siege of Neuss, made an alliance with Edward IV of England, received the surrender of Lorraine, and hastened across the Jura (February 1476) to the aid of his ally Yolande. On February 21 Charles laid siege to Granson, and after a week's siege the garrison of Bernese and Freiburgs had to surrender, and, by way of retaliation for the massacre of the garrison of Estavayer in 1475, of the 112 men two only were spared in order to act as executioners of their comrades. This hideous news met a large body of the Confederates gathered together in great haste to relieve the garrison, and going to their rendezvous at Neuchâtel, where both the count and town had become allies of Bern in 1406. An advance body of Bernese, Freiburgs, and Schwyzers, in order to avoid the castle of Vauxmarais (seized by Charles), by the Lake of Neuchâtel, on the direct road from Neuchâtel to Granson, climbed over a wooded spur to the north, and attacked (March 2) the Burgundian outposts. Charles drew back his force in order to bring down the Swiss to the more level ground where his cavalry could act, but his rear misinterpreted the order, and when the main Swiss force appeared over the spur the Burgundian army was seized with a panic and fled in disorder. The Swiss had gained a glorious victory, and regained their conquest of Granson, besides capturing very rich spoil in Charles's camp, parts of which are preserved to the present day in various Swiss armouries. Such was the famous battle of Granson. Charles at once retired to Lausanne, and set about reorganizing his army. He resolved to advance on Bern by way of Morat (or Murten), which was occupied by a Bernese garrison under Von Bubenberg, and laid siege to it on June 9. The Confederates had now put away all jealousy of Bern, and collected a large army. The decisive battle took place on the afternoon of June

22, after the arrival of the Zurich contingent under Hans Waldmann. English archers were in Charles's army, while with the Swiss was Rene, the dispossessed duke of Lorraine. After facing each other many hours in the driving rain, a body of Swiss, by outflanking Charles's van, stormed his palisaded camp, and the Burgundians were soon hopelessly beaten, the losses on both sides (a contrast to Granson) being exceedingly heavy. Vaud was reoccupied by the Swiss, Savoy having overrun it on Charles's advance, but Louis now stepped in and procured the restoration of Vaud to Savoy, save Granson, Morat, Orbe, and Echallens, which were to be held by the Bernese jointly with the Freiburgers, Aigle by Bern alone—Savoy at the same time renouncing all its claims over Freiburg. Thus French-speaking districts first became permanently connected with the Confederation, hitherto purely German, and the war had been one for the maintenance of recent conquests, rather than a purely defensive one against an encroaching neighbour desirous of crushing Swiss freedom. Charles tried in vain to raise a third army, Rene recovered Lorraine, and on January 5, 1477, under the walls of Nancy, Charles's wide-reaching plans were ended by his defeat and death, many Swiss being with Rene's troops. The wish of the Bernese to overrun Franche Comte was opposed by the older members of the Confederation, and finally, in 1479, Louis, by very large payments, secured the abandonment of all claims on that province, which was annexed to the French crown.

Internal
disputes
in the
League.

These glorious victories really laid the foundation of Swiss nationality, but soon after them the long-standing jealousy between the civic and rural elements in the Confederation nearly broke it up. This had always hindered common action save in case of certain pressing questions. In 1370, by the "Parsons' ordinance" (Pfaffenbrief), agreed on by all the Confederates except Bern and Glarus, all residents, whether clerics or laymen, in the Confederation who were bound by oath to the duke of Austria were to swear faith to the Confederation, and this oath was to rank before any other, no appeal was to lie to any court spiritual or lay (except in matrimonial and purely spiritual questions) outside the limits of the Confederation, and many regulations were laid down as to the suppression of private wars and keeping of the peace on the high roads. Further, in 1393, the "Sempach ordinance" was accepted by all the Confederates and Solothurn, this was an attempt to enforce police regulations and to lay down "articles of war" for the organization and discipline of the army of the Confederates, minute regulations being made against plundering, —women, monasteries, and churches being in particular protected and secured. But save these two documents common action was limited to the meeting of two envoys from each member of the Confederation and one from each of the "soci" in the diet, the powers of which were greatly limited by the instructions brought by each envoy, thus entailing frequent reference to his Government, and included foreign relations, war and peace, and common arrangements as to police, pestilence, customs duties, coinage, &c. The decisions of the majority did not bind the minority save in the case of the affairs of the bailiwicks ruled in common. Thus everything depended on common agreement and goodwill. But disputes as to the division of the lands conquered in the Burgundian war, and the proposal to admit into the League the towns of Freiburg and Solothurn, which had rendered such good help in the war, caused the two parties to form separate unions, for by the latter proposal the number of towns would have been made the same as that of the "Länder," which these did not all approve. Suspended a moment by the campaign in the Val Leventina, these quarrels broke out

after the victory of Giornico, and at the diet of Stanz (December 1481), when it seemed probable that the failure of all attempts to come to an understanding would result in the disruption of the League, the mediation of Nicholas von der Flüe (or Bruder Klaus), a holy hermit of Sachseln in Obwald, though he did not appear at the diet in person, succeeded in bringing both sides to reason, and the third great ordinance of the League—the "compact of Stanz"—was agreed on. By this the promise of mutual aid and assistance was renewed, especially when one member attacked another, and stress was laid on the duty of the several Governments to maintain the peace, and not to help the subjects of any other member in case of a rising. The treasure and movables captured in the war were to be equally divided amongst the combatants, the territories and towns amongst the members of the League. As a practical proof of the reconciliation, on the same day the towns of Freiburg and Solothurn were received as full members of the Confederation, united with all the other members, though on less favourable terms than usual, for they were forbidden to make alliances, save with the consent of all or of the greater part of the other members. Both towns had long been allied with Bern, whose influence was greatly increased by their admission. Freiburg, founded in 1178 by Berthold IV of Züringen, had on the extinction of that great dynasty (1218) become a free imperial city, but had bowed successively to Kyburg (1249), Austria, the sons of Rudolph (1277) and Savoy (1452), when Savoy gave up its claims in 1477 Freiburg once more became a free imperial city. She had become allied with Bern as early as 1243. The ancient Roman city of Solothurn (or Soleure) had been associated with Bern from 1351, but had in vain sought admission into the League in 1411. Both the new members had done much for Bern in the Burgundian war, and it was for their good service that she now procured them this splendid reward, in hopes perhaps of aid on other important and critical occasions.

The compact of Stanz strengthened the bonds which joined the members of the Confederation, and the same centralizing tendency is well seen in the attempt (1483–89) of Hans Waldmann, the burgomaster of Zurich, to assert the rule of his city over the neighbouring country districts, to place all power in the hands of the guilds (whereas by Brun's constitution the patricians had an equal share), to suppress all minor jurisdictions, and to raise a uniform tax. But this idea of concentrating all powers in the hands of the Government aroused great resistance, and led to his overthrow and execution. Peter Kistler succeeded (1470) better at Bern in a reform on the same lines, but not of such a sweeping character.

The early history of each member of the Confederation, and of the Confederation itself, shows that they always professed to belong to the empire, trying to become immediately dependent on the emperor in order to prevent the oppression of middle lords, and to enjoy practical liberty. The empire itself had now become very much of a shadow, cities and princes were gradually asserting their own independence, sometimes breaking away from it altogether. Now, by the time of the Burgundian war the Confederation stood in a position analogous to that of a powerful free imperial city. As long as the emperor's nominal rights were not enforced, all went well, but, when Maximilian, in his attempt to reorganize the empire, erected in 1495 at Worms an imperial chamber which had jurisdiction in all disputes between members of the empire, the Confederates were very unwilling to obey it, partly because they could maintain peace at home by their own authority, and partly because it interfered with their practical independence. Again, their refusal to join the

Practical
freedom
from the
empire.

"Swabian League," formed in 1488 by the lords and cities of South Germany to keep the public peace, gave further offence, as well as their fresh alliances with France. Hence a struggle was inevitable, and the occasion by reason of which it broke out was the seizure by the Tyrolean authorities in 1499 of the Münsterthal, which belonged to the "Gotteshausbund," one of the three leagues which had gradually arisen in Rhaetia. These were the "Gotteshausbund" in 1367 (taking in all the dependents of the cathedral church at Chur living in the Oberhalbstein and Engadine), the "Oberer or Grauer Bund" in 1395 and 1424 (taking in the abbot of Disentis and many counts and lords in the Vorder Rhein valley, though its name is not derived, as often stated, from the "grey coats" of the first members, but from "grawen" or "grafen," as so many counts formed part of it), and the "League of the Ten Jurisdictions" (Zehngerichtenbund), which arose in the Prättigau and Davos valley (1436) on the death of Count Frederick of Toggenburg, but which, owing to certain Austrian claims in it, was not quite so free as its neighbours. The first and third of these became allied in 1450, but the formal union of the three dates only from 1524, as documentary proof is wanting of the alleged meeting at Vazerol in 1471, though practically before 1524 they had very much in common. In 1497 the Oberer Bund, in 1498 the Gotteshausbund, made a treaty of alliance with the Everlasting League or Swiss Confederation, the Ten Jurisdictions being unable to do more than show sympathy, owing to Austrian influence, which was not bought up till 1649-52. Hence this attack on the Münsterthal was an attack on an "associate" member of the Swiss Confederation, Maximilian being supported by the Swabian League, but its real historical importance is the influence it had on the relations of the Swiss to the empire. The struggle lasted several months, the chief fight being that "an der Calven" or "auf der Malserheide" (May 22, 1499), in which Benedict Fontana, a leader of the Gotteshausbund men, performed many heroic deeds before his death. But, both sides being exhausted, peace was made at Basel on September 22, 1499. By this the matters in dispute were referred to arbitration, and the emperor annulled all the decisions of the imperial chamber against the Confederation, but nothing was laid down as to its future relations with the empire. No further real attempt, however, was made to enforce the rights of the emperor, and the Confederation became a state allied with the empire, enjoying practical independence, though not formally freed till 1648. Thus, 208 years after the origin of the Confederation, it had got rid of all Austrian claims (1394 and 1474), as well as all practical subjection to the emperor. But its further advance towards the position of an independent state was long checked by religious divisions within, and by the enormous influence of the French king on its foreign relations.

With the object of strengthening the northern border of the Confederation, two more full members were admitted in 1501—Basel and Schaffhausen—on the same terms as Freiburg and Solothurn. The city of Basel had originally been ruled by its bishop, but in the 14th century it became a free imperial city, before 1501 it had made no permanent alliance with the Confederation, though in continual relations with it. Schaffhausen had grown up round the Benedictine monastery of All Saints, and became in the 13th century a free imperial city, but was pledged to Austria from 1330 to 1415, in which last year the emperor Sigismund declared all Duke Frederick's rights forfeited in consequence of his abetting the flight of Pope John XXII. It had become an "associate" of the Confederation in 1454.

A few years later, in 1513, Appenzell, which in 1411 had become a "protected" district, and in 1452 an "associate" member of the Confederation, was admitted as the thirteenth full member, and thus remained the number till the fall of the old Confederation in 1798. Round the three original members had gathered first five others, united with the three, but not necessarily with each other, and then gradually there grew up an outer circle, consisting of five more, allied with all the eight old members, but tied down by certain stringent conditions. Constance, which seemed called by nature to enter the League, kept aloof, owing to a quarrel as to the criminal jurisdiction in the Thurgau, which had been pledged to it before the district was conquered by the Confederates. Neuchâtel in 1495-98 became permanently allied with several members of the Confederation.

In the first years of the 16th century the influence of the Confederates south of the Alps was largely extended. The system of giving pensions, in order to secure the right of enlisting men within the Confederation, and of capitulations, by which the different members supplied troops, was originated by Louis XI in 1474, and later followed by many other princes. Though a tribute to Swiss valour and courage, this practice had very evil results, of which the first fruits were seen in the Milanese (1500-1516). Both Charles VIII (1484) and Louis XII (1499 for ten years) renewed Louis XI's treaty. The French attempts to gain Milan were largely carried on by the help of Swiss mercenaries, some of whom were on the opposite side, and, as brotherly feeling was still too strong to make it possible for them to fight against one another, Ludovico Sforza's Swiss troops shamefully betrayed him to the French at Novara (1500). In 1500, too, the three Forest districts occupied Bellinzona at the request of its inhabitants, and in 1503 Louis XII was forced to cede it to them. He, however, often held back the pay of his Swiss troops, and treated them as mere hirelings, so that when the ten years' treaty came to an end Matthew Schinner, bishop of Sitten (or Sion), induced them to join (1510) the pope, Julius II, then engaged in forming the Holy League to expel the French from Italy. But when, after the battle of Ravenna, Louis XII became all powerful in Lombardy, 20,000 Swiss poured down into the Milanese and occupied it, Schind, the burgomaster of Zurich, naming Maximilian (Ludovico's son) duke of Milan, in return for which he ceded to the Confederates Locarno, Val Maggia, Mendrisio, and Lugano (1512), while the Rhaetian leagues received Chiavenna, Boimio, and the Valtellina. (The former districts, with Bellinzona and the Val Leventina, were in 1803 made into the canton of Ticino, the latter were held by Rhaetia till 1797.) In 1513 the Swiss completely defeated the French at Novara, and in 1515 Paeo was sent by Henry VIII of England to give pensions and get soldiers. Francis I at once on his accession (1515) began to prepare to win back the Milanese, and, successfully evading the Swiss awaiting his descent from the Alps, beat them in a pitched battle at Marignano near Milan (September 13, 1515), which broke the Swiss power in North Italy, so that in 1516 a peace was made with France,—Wals, the Rhaetian leagues, and St Gall being included on the side of the Confederates. Provisions were made for the neutrality of either party in case the other became involved in war, and large pensions were promised. This treaty was extended by another in 1521 (to which Zurich, then under Zwingli's influence, would not agree, holding aloof from the French alliance till 1614), by which the French king might, with the consent of the Confederation, enlist any number of men between 6000 and 16,000, paying them fit wages, and the pensions were raised to 3000 francs annually to each member of the Confederation. These two treaties were

the starting point and foundation of later French interference with Swiss affairs, which became more and more oppressive, and was not finally thrown off till 1814.

The
Refor-
mation

IV In 1499 the Swiss had practically renounced their allegiance to the emperor, the temporal chief of the world according to mediæval theory, and in the 16th century a great number of them did the same by the world's spiritual chief, the pope. The scene of the revolt was Zurich, and the leader Ulrich Zwingli. But we cannot understand Zwingli's career unless we remember that he was almost more a political reformer than a religious one. In his former character his policy was threefold. He bitterly opposed the French alliance and the pension and mercenary system, for he had seen its evils with his own eyes when serving as chaplain with the troops in the Milanese in 1512 and 1515. Hence in 1521 his influence kept Zurich back from joining in the treaty with Francis I. Then, too, at the time of the Peasant Revolt (1525), he did what he could to lighten the harsh rule of the city over the neighbouring rural districts, and succeeded in getting serfage abolished. Again he had it greatly at heart to secure for Zurich and Bern the chief power in the Confederation, because of their importance and size, he wished to give them extra votes in the diet, and would have given them two-thirds of the "common bailiwicks" when these were divided. In his character as a religious reformer we must remember that he was a humanist, and deeply read in classical literature, which accounts for his turning the canonries of the Grossmünster into professorships, reviving the old school of the Carolinum, and relying on the arm of the state to carry out religious changes. His theology sprang from a single ruling principle—the absolute and unlimited sovereignty of God. Hence his profound respect for the letter of the Bible led him to "legalism" and extreme Sabbatarianism. Hence his view of the incarnation bordered on Unitarianism, and sacraments were mere signs of that which is already given, hence too sprang his denial of man's free will and his belief in absolute election and reprobation. Nay, God, being the absolute Author of all things, is the Author of evil, though He is not immoral, for He is above law, and what is morally wrong for man is not so for God. Zwingli began to preach the new views as early as 1516, long before and quite independently of Luther, but it was only when at the end of 1518 he was called to Zurich as parish priest that he began to make any noise, and in fact it was even later (1522), when his admirers allowed themselves to eat flesh in Lent, that disturbances arose, and the diet forbade all preaching which would disturb the public peace. But, after succeeding at two public disputations, his views rapidly gained ground at Zurich, which long, however, stood quite alone, the other Confederates issuing an appeal to await the decision of the asked-for general council, and proposing to carry out by the arm of the state certain small reforms, while clinging to the old doctrines. Zwingli had to put down the extreme wing of the Reformers—the Anabaptists—by force. Quarrels too arose as to allowing the new views in the "common bailiwicks." The disputation at Baden (1526) was in favour of the maintainers of the old faith, but that at Bern (1528) resulted in securing for the new views the support of that great town, and so matters began to take another aspect. In 1528 Bern joined the union formed in 1527 in favour of religious freedom by Zurich and Constance (*Christliches Burgrecht*), and her example was followed by Schaffhausen, St Gall, Basel, and Mühlhausen. This attempt to virtually break up the League was met in February 1529 by the offensive and defensive alliance made with King Ferdinand of Hungary (brother of the emperor) by the three Forest districts,

with Lucerne and Zug, followed (April 1529) by the "Christliche Vereinigung," or union between these five members of the League. Zurich was greatly moved by this, and, as Zwingli held that for the honour of God war was as necessary as iconoclasm, war seemed imminent, but Bern held back, and the first peace of Kappel was concluded (June 1529), by which the Hungarian alliance was annulled and the principle of "religious parity" (or freedom) was admitted in the case of each member of the League and in the "common bailiwicks." This was at once a victory and a check for Zwingli. He tried to make an alliance with the Protestants in Germany, but failed at the meeting at Marburg (October 1529) to come to an agreement with Luther on the subject of the eucharist, and the division between the Swiss and the German Reformations was stereotyped. Zwingli now developed his views as to the greater weight which Zurich and Bern ought to have in the League. Quarrels too went on in the "common bailiwicks," for the members of the League who clung to the old faith had a majority of votes in matters relating to these districts. Zurich tried to cut off supplies of food from reaching the Catholic members (contrary to the wishes of Zwingli), and, on the death of the abbot of St Gall, disregarding the rights of Lucerne, Schwyz, and Glarus, who shared with her the office of protectors of the abbey, suppressed the monastery, giving the rule of the land and the people to her own officers. Bern in vain tried to moderate this aggressive policy, and the Catholic members of the League indignantly advanced towards Zurich. Near Kappel, on October 11, 1531, the Zurich vanguard under Göldli was (perhaps owing to his treachery) surprised, and despite reinforcements the men of Zurich were beaten, among the slain being Zwingli himself. Another defeat completed the discomfiture of Zurich, and by the second peace of Kappel (November 1531) the principle of "parity" was recognized, not merely in the case of each member of the League and the "common bailiwicks," but also in that of each parish or "commune." Thus everywhere the rights of a minority were protected from the encroachments of the majority. The "Christliches Burgrecht" was abolished, and Zurich condemned to pay heavy damages. Bullinger succeeded Zwingli, but this treaty meant that neither side could now try to convert the other wholesale. The League was permanently split into two religious camps: the Catholics, who met at Lucerne, numbered, besides the five already mentioned, Freiburg, Solothurn, Appenzell (Inner Rhoden), and St Gall (with Wallis), thus commanding seventeen votes (out of twenty-nine) in the diet; the Evangelicals were Zurich, Bern, Basel, Schaffhausen, Appenzell (Outer Rhoden) (with Graubünden), who met at Aarau, while Thurgau and Glarus were divided.

Bern had her eyes always fixed upon the Savoyard Conquest of Vaud lands to the south-west, in which she had got a footing in 1475, and now made zeal for religious reforms the excuse for resuming her advance policy. In 1526 William Farel, a preacher from Dauphiné, had been sent to reform Aigle, Morat, and Neuchâtel. In 1532 he came to Geneva, an ancient city of which the rule had long been disputed by the prince-bishop, the burgesses, and the house of Savoy, the latter holding the neighbouring districts. She had become in 1519 the ally of Freiburg, in 1526 that of Bern also, and in 1530, by their influence, a peace was made between the contending parties. (In 1531 Bonnivard, the prior of St Victor, for joining a rising in favour of political liberty, was imprisoned in the castle of Chillon, remaining there till 1536.) The religious changes introduced by Farel greatly displeased Freiburg, which abandoned the alliance (1534), and in 1535 the Reformation was firmly planted in the city. The duke of

Savoy, however, took up arms against Bern (1536), who overran Gex, Vaud, and the independent bishopric of Lausanne, as well as the Chablais to the south of the lake. Geneva was only saved by the unwillingness of the citizens. Bern thus ruled north and south of the lake, and carried matters with a high hand. Shortly after this John Calvin, a refugee from Picardy, was, when passing through Geneva, detained by Farel to aid him, and, after an exile from 1538-1541, owing to opposition of the papal party, and of the burghers, who objected to Bernese rule, he set up his wonderful theocratic government in the city, pushing Zwingli's principles to their ultimate conclusions (see *SERVETUS*) (1553), and in 1555 expelling many who upheld municipal liberty, replacing them by French, English, Italians, and Spaniards as new burghers, whose names are still frequent in Geneva (*e.g.*, Candolle, Mallet, Diodati). His theological views led to disputes with the Zurich Reformers, which were partly settled by the *Consensus Tigurinus* of 1549, and more completely by the *Helvetic Confession* of 1566, which formed the basis of union between the two parties.

By the time of Calvin's death (1564) the old faith had begun to take the offensive, the reforms made by the council of Trent urged on the Catholics to make an attempt to recover lost ground. Emmanuel Philibert, duke of Savoy, the hero of St Quentin (1557), and one of the greatest generals of the day, with the support of the Catholic members of the League, demanded the restoration of the districts seized by Bern in 1536, and on October 30, 1564, the treaty of Lausanne confirmed the decision of the other Confederates sitting as arbitrators (according to the old constitutional custom). By this treaty Gex, the Genevois, and the Chablais were to be given back, while Vevey, Chillon, Lausanne, Yverdon were to be kept by Bern, who engaged to maintain the old rights and liberties of Vaud, which in 1565 were further placed under the special protection of France. Thus Bern lost the lands south of the lake, in which St Francis of Sales, the exiled prince-bishop of Geneva, at once proceeded to carry out the restoration of the old faith. In 1555 Bern and Freiburg, as creditors of the debt-laden count, divided the county of Gruyères, thus getting fresh French-speaking subjects. In 1558 Geneva renewed her alliance with Bern, and in 1584 she made one with Zurich.

The
Counter
Refor-
mation

The decrees of the council of Trent had been accepted fully by the Catholic members of the League, so far as relates to dogma, but not as regards discipline or the relations of church and state, the sovereign rights and jurisdiction of each state being always carefully reserved. The Counter Reformation, however, or reaction in favour of the old faith, was making rapid progress in the Confederation, mainly through the indefatigable exertions of Charles Borromeo, from 1560 to 1584 archbishop of Milan (in which diocese the Italian bailiwicks were included), and nephew of Pius IV, supported at Lucerne by Ludwig Pflyffer, who, having been (1562-1570) the chief of the Swiss mercenaries in the French wars of religion, did so much till his death (1594) to further the religious reaction at home that he was popularly known as the "Swiss king." In 1574 the Jesuits, the great order of the reaction, were established at Lucerne, in 1579 a papal nuncio came to Lucerne, Charles Borromeo founded the "Collegium Helveticum" at Milan for the education of forty two young Swiss, and the Catholic members of the League made an alliance with the bishop of Basel, in 1581 the Capuchins were introduced to influence the more ignorant classes. Most important of all was the Golden or Borromean League, concluded (October 5, 1586) between the seven Catholic members of the Confederation (Uri, Schwyz, Unterwalden, Lucerne, Zug, Freiburg, and Solo-

thurn) for the maintenance of the true faith in their territories, each engaging to punish backsliding members and to help each other if attacked by external enemies, notwithstanding any other leagues, old or new. This league marks the final breaking up of the Confederation into two great parties, which greatly hindered its progress. The Catholic members had a majority in the diet, and were therefore able to refuse admittance to Geneva, Strasburg, and Muhlhausen. Another result of these religious differences was the breaking up of Appenzell into two bits (1597), each sending one representative to the diet—"Inner Rhoden" remaining Catholic, "Ausser Rhoden" adopting the new views. We may compare with this the action of Zurich in 1555, when she received the Protestant exiles from Locarno and the Italian bailiwicks into her burghership, and Italian names are found there to this day (*e.g.*, Orelli, Muralt). The duke of Savoy made several vain attempts to get hold of Geneva, the last (in 1602) being known as the "Escalade."

In the Thirty Years' War the Confederation remained neutral, being bound both to Austria (1474) and to France (1516), and neither religious party wishing to give the other an excuse for calling in foreign armies. But the troubles in Rhetia threatened entanglements. Austria wished to secure the Munsterthal (belonging to the League of the Ten Jurisdictions), and Spain wanted the command of the passes leading from the Valtelline (conquered by the leagues of Rhetia in 1512), the object being to connect the Hapsburg lands of Tyrol and Milan. In the Valtelline the rule of the Three Leagues was very harsh, and Spanish intrigues easily brought about the massacre of 1620, by which the valley was won, the Catholic members of the Confederation stopping the troops of Zurich and Bern. In 1622 the Austrians conquered the Prattigau, over which they still had certain feudal rights. French troops regained the Valtelline in 1624, but it was lost once more in 1629 to the imperial troops, and it was not till 1635 that the French, under Rohan, finally succeeded in holding it. The French, however, wished to keep it permanently, hence new troubles arose, and in 1637 the natives, under George Jenatsch, with Spanish aid drove them out, the Spaniards themselves being forced to resign it in 1639. It was only in 1649-52 that the Austrian rights in the Prattigau were finally bought up by the League of the Ten Jurisdictions, which thus gained its freedom.

In consequence of Ferdinand II's edict of restitution (1629), by which the *status quo* of 1552 was re-established—the high-water mark of the Counter Reformation—the abbot of St Gall tried to make some religious changes in his territories, but the protest of Zurich led to the Baden compromise of 1632, by which, in the case of disputes on religious matters arising in the "common bailiwicks," the decision was to be, not by a majority, but by means of friendly discussion—a logical application of the doctrine of religious parity—or by arbitration.

But by far the most important event in Swiss history in this age is the formal freeing of the Confederation from the empire. Basel had been admitted a member of the League in 1501, two years after the Confederation had been practically freed from the jurisdiction of the imperial chamber, though the city was included in the new division of the empire into "circles" (1521), which did not take in the older members of the Confederation. Basel, however, refused to admit this jurisdiction, the question was taken up by France and Sweden at the congress of Münster, and formed the subject of a special clause in the treaties of Westphalia, by which the city of Basel and the other "Helvetorum cantones" were declared to be "in the possession of almost entire liberty and exemption from the empire, and *nullatenus* subject

to the imperial tribunals." This was intended to mean exemption from all obligations to the empire (with which the Confederation was connected hereafter simply as a friend), and to be a definitive settlement of the question. Thus by the events of 1499 and 1648 the Confederation had become an independent European state, which, by the treaty of 1516, stood as regards France in a relation of neutrality.

In 1668, in consequence of Louis XIV's temporary occupation of the Franche Comté, an old scheme for setting the number of men to be sent by each member of the Confederation to the joint army, and the appointment of a council of war in war time, that is, an attempt to create a common military organization, was accepted by the diet, which was to send two deputies to the council, armed with full political powers. This agreement, known as the *Defensionale*, is the only instance of joint and unanimous action in this miserable period of Swiss history, when religious divisions crippled the energy of the Confederation.

"Throughout the 17th and 18th centuries the Confederation was practically a dependency of France. In 1611 Zurich for the first time joined in the treaty, which was renewed in 1663 with special provisions as regards the Protestant Swiss mercenaries in the king's pay and a promise of French neutrality in case of civil war in the League. The Swiss had to stand by while Louis XIV won Alsace (1648), Franche Comté (1678), and Strasburg (1681). But, as Louis inclined more and more to an anti-Protestant policy, the Protestant members of the League favoured the Dutch military service, and it was through their influence that in 1707 the "states" of the principality of Neuchâtel, on the extinction of the Longueville line of these princes, decided in favour of the king of Prussia (representing the overlords—the house of Châllon Orange) as against the various French pretenders claiming from the Longueville dynasty by descent or by will. In 1715 the Catholic members of the League, in hopes of retrieving their defeat of 1712 (see below), agreed, while renewing the treaty and capitulations, to put France in the position of the guarantor of the League, with rights of interfering, in case of attack from within or from without, whether by counsel or arms. This last clause was simply the surrender of Swiss independence, and was strongly objected to by the Protestant members of the Confederation, so that in 1777 it was dropped, when all the Confederates made a fresh defensive alliance, wherein their sovereignty and independence were expressly set forth. Thus France had succeeded to the position of the empire with regard to the Confederation, save that her claims were practically asserted and voluntarily admitted.

Between 1648 and 1798 the Confederation was distracted by religious divisions, and feelings ran very high. A scheme to set up a central administration fell through in 1655, through jealousy of Bern and Zurich, the proposers. In 1656 a question as to certain religious refugees, who were driven from Schwyz and took refuge at Zurich, brought about the first Villmergen war, in which the Catholics were successful, and procured a clause in the treaty asserting very strongly the absolute sovereignty in religious as well as in political matters of each member of the League within its own territories. Later, the attempt of the abbot of St Gall to enforce his rights in the Toggenburg swelled into the second Villmergen war (1712), which turned out very ill for the defeated Catholics. Zurich and Bern were henceforth to hold in severalty Baden, Rapperschwil, and part of the "common bailiwicks" of the Aargau, both towns being given a share in the government of the rest, and Bern in that of Thurgau and Rheintal, from which as well as from that part of Aargau she had been carefully excluded in 1415 and 1460.

The only thing that prospered was the principle of "religious parity," which was established by every treaty.

The diet had few powers, the Catholics had the majority there, the sovereign rights of each member of the League and the limited mandate of the envoys effectually checked all progress. Zurich, as the leader of the League, managed matters when the diet was not sitting, but could not enforce her orders. The Confederation was little more than a collection of separate atoms, and it is really marvellous that it did not break up through its own weakness.

In these same two centuries, the chief feature in domestic Swiss politics is the growth of an aristocracy: the power of voting and the power of ruling are placed in the hands of a small class. This is chiefly seen in Bern, Lucerne, Freiburg, and Solothurn, where there were not the primitive democracies of the Forest districts nor the government by guilds as at Zurich, Basel, and Schaffhausen. It was effected by refusing to admit any new burghers, a practice which dates from the middle of the 16th century, and is connected (like the similar movement in the smaller local units of the "communes" in the rural districts) with the question of poor relief after the suppression of the monasteries. Outsiders (Hinterwälder or Niedgelassene) had no political rights, however long they might have resided, while the privileges of burghership were strictly hereditary. Further, within the burghers, a small class succeeded in securing the monopoly of all public offices, which was kept up by the practice of co-opting, and was known as the "patriciate." So in Bern, out of 360 burgher families, 80 (in 1776 18 only) formed the ruling oligarchy, and, though to foreigners the government seemed admirably managed, yet the last thing that could be said of it was that it was democratic. In 1749 Henzi made a fruitless attempt to overthrow this oligarchy, like Fatio at Geneva in 1707. The harsh character of Bernese rule (and the same holds good with reference to Uri and the Val Leventina) was shown in the great strictness with which Vaud was kept in hand: it was ruled as a conquered land by a benevolent despot, and we can feel no surprise that Davel in 1723 tried to free his native land, or that it was in Vaud that the principles of the French Revolution were most eagerly welcomed. Another result of this aristocratic tendency was the way in which the cities despised the neighbouring country districts, and managed gradually to deprive them of their equal political rights and to levy heavy taxes upon them. These and other grievances (the fall in the price of food after the close of the Thirty Years' War, the lowering of the value of the coin, &c.), combined with the presence of many soldiers discharged after the great war, led to the great Peasant Revolt (1653) in the territories of Bern, Solothurn, Lucerne, and Basel, interesting historically as being the first popular rising since the old days of the 13th and 14th centuries, and because reminiscences of legends connected with those times led to the appearance of the "three Tells," who greatly stirred up the people. The rising was put down at the cost of much bloodshed, but the demands of the peasants were not granted. Yet during this period of political powerlessness a Swiss literature first arises. Gessner and Tschudi in the 16th century are succeeded by Scheuchzer, Haller, Lavater, Bodmer, De Saussure, Rousseau, J. von Müller, the taste for Swiss travel is stimulated by the publication of Ebel's guide-book, based on the old *Dehelix*, industry thrives greatly. The residence of such brilliant foreign writers as Voltaire and Gibbon within or close to the territories of the Confederation helped on this remarkable intellectual revival. Political aspirations were not, however, wholly crushed, and found their centre in the Helvetic Society, founded in 1762 by Balthasar and others.

French influence, religious divisions, and rise of an aristocracy

Effects
of the
French
Revolu-
tion on
the Con-
federation

The Confederation and France had been closely connected for so long that the outbreak of the French Revolution could not fail to affect the Swiss. The Helvetic Club, founded at Paris in 1790 by several exiled Vauds and Freiburgers, was the centre from which the new ideas were spread in the western part of the Confederation, and risings directed or stirred up. In 1790 Lower Wallis rose against the oppressive rule of the upper districts, in 1792 Porrentruy defied the prince-bishop of Basel, despite the imperial troops he summoned, declared the "Rauracian" republic, and three months later became the French department of the Mont Terrible, Geneva was only saved (1792) from France by a force sent from Zurich and Bern, and the massacre of the Swiss guard at the Tuileries on August 10, 1792, aroused intense indignation. The rulers, however, unable to enter into the new ideas, contented themselves with suppressing them by force, e.g., Zurich in the case of Stafa (1795). St Gall managed to free itself from its abbot (1795-97), but the Lagues of Rhetia so oppressed their subjects in the Valtelline that in 1797 Bonaparte (after conquering the Milanese from the Austrians) joined them to the Cisalpine republic. The diet was distracted by party struggles, and the fall of the old Confederation was not far distant. The rumours of the vast treasures stored up at Bern, and the desire of securing a bulwark against Austrian attack, specially turned the attention of the Directory towards the Confederation, and this was utilized by the heads of the reform party in the Confederation,—Ochs, the burgo-master of Basel, and La Harpe, who had left his home in Vaud through disgust at Bernese oppression, both now wishing for aid from outside in order to free their land from the rule of the oligarchy. Hence, when La Harpe, at the head of twenty-two exiles from Vaud and Freiburg, called (November 20, 1797) on the Directory to protect the liberties of Vaud, which France by the treaty of 1565 was bound to guarantee, his appeal found a ready answer. In 1798 French troops occupied Muhlhausen and Bionno (Biel), as well as those parts of the lands of the prince-bishop of Basel (St. Imier and the Munsterthal) as regards which he had been since 1579 the ally of the Catholic members of the Confederation. Another army entered Vaud (February 1798), when the "Lemanic republic" was proclaimed, and the diet broke up in dismay without taking any steps to avert the coming storm. Brune and his army occupied Freiburg and Solothurn, and, after fierce fighting at Neueneck, entered (March 5) Bern, deserted by her allies, and distracted by quarrels within. With Bern, the stronghold of the aristocratic party, fell the old Confederation. The Revolution triumphed throughout the Confederation. Brune, on March 19, put forth a wonderful scheme by which the Confederation with its "associates" and "subjects" was to be split into three republics—the Tellgau (i.e., the Forest districts), the Rhodanic (i.e., Vaud, Wallis, the Bernese Oberland, and the Italian bailiwicks), and the Helvetic (i.e., the north and east portions), but the Directory disapproved of this (March 23) and on March 29 the Helvetic republic, one and indivisible, was proclaimed. This was accepted by ten out of the thirteen members of the old Confederation, as well as the constitution drafted by Ochs. By the new scheme the territories of the Everlasting League were split up into twenty-three (later nineteen, Rhetia only coming in in 1799) administrative districts, called "cantons," a name now officially used in Switzerland for the first time, though it may be found employed by foreigners in the French treaty of 1452, in Comines and Machiavelli, and in the treaties of Westphalia (1648). A central Government was set up, with its seat at Lucerne, comprising a senate and a great council, together forming the legislature, with an

executive of five directors chosen by the legislature, and having four ministers as subordinates or "chief secretaries." A supreme court of justice was set up, a status of Swiss citizenship was recognized, and absolute freedom to settle in any canton was given, the political "communes" being now composed of all residents, and not merely of the burghers. For the first time an attempt was made to organize the Confederation as a single state, but the change was too sweeping to last, for it largely ignored the local patriotism which had done so much to create the Confederation, though more recently it had made it politically powerless. The three Forest districts rose in rebellion against the invaders and the new constitutions which destroyed their ancient prerogatives, but the valiant resistance of the Schwyzers, under Alois Reding, on the heights of Morgarten (April and May), and that of the Untervaldners (September), were put down by French armies. The proceedings of the French, however, soon turned into disgust and hatred the joyful feelings with which they had been hailed as liberators. Geneva was annexed to France (1798), Gersan, after an independent existence of over 400 years, was made a mere district of Schvyz, immense fines were levied and the treasury at Bern pillaged, the land was treated as if it had been conquered. The new republic was compelled to make a very close offensive and defensive alliance with France, and its directors were practically nominated from Paris. In 1799 Zurich, the Forest cantons, and Rhetia became the scene of the struggles of the Austrians (welcomed with joy) against the French and Russians. The manner too in which the reforms were carried out alienated many, and, soon after the Directory gave way to the Consulate in Paris (18 Brumaire or November 10, 1799), the Helvetic directory (January 1800) was replaced by an executive committee.

The scheme of the Helvetic republic had gone too far in the direction of centralization, but it was not easy to find the happy mean, and violent discussions went on between the "unitary" (headed by Ochs and La Harpe) and "federalist" parties. Many drafts were put forward, and one actually submitted to but rejected by a popular vote (May 20, 1802). In July 1802 the French troops were withdrawn from Switzerland by Bonaparte, ostensibly to comply with the treaty of Amiens, really to show the Swiss that their best hopes lay in appealing to him. The Helvetic Government was gradually driven back by armed force, and the federalists seemed getting the best of it, when (October 4) Bonaparte offered himself as mediator, and summoned many of the chief Swiss statesmen to Paris to discuss matters with him (the "Consulta"—December 1802). He had long taken a very special interest in Swiss matters, and in 1802 had given to the Helvetic republic the Frickthal (ceded to France in 1801 by Austria), the last Austrian possession within the borders of the Confederation. On the other hand, he had made (November 1802) Wallis into an independent republic. In the discussions he pointed out that Swiss needs required a federal constitution and a neutral position guaranteed by France. Finally (February 19, 1803) he laid before the Consulta the Act of Mediation which he had elaborated, and which they had perforce to accept—a document which formed a new departure in Swiss history, and the influence of which is visible in the present constitution.

Throughout, "Switzerland" is used for the first time as the official name of the Confederation. The thirteen members of the old Confederation before 1798 are set up again, and to them are added six new cantons,—two (St Gall and Graubünden or Grisons) having been formerly "associates," and the four others being made up of the

diation.

subject lands conquered at different times,—Aargau (1415), Thurgau (1460), Ticino or Tessin (1440, 1500, 1512), and Vaud (1536). In the diet, six cantons which had a population of more than 100,000 (*viz.*, Bern, Zurich, Vaud, St Gall, Graubünden, and Aargau) were given two votes, the others having but one apiece, and the deputies were to vote freely within limits, though not against their instructions. Meetings of the diet were to be held alternately at Freiburg, Bern, Solothurn, Basel, Zurich, and Lucerne,—the Government of each of these cantons becoming, by virtue of the presence of the diet, the executive of the Confederation, its chief magistrate being named the “landamman of Switzerland.” The “*landsgemeinden*,” or popular assemblies, were restored in the democratic cantons, the cantonal governments in other cases being in the hands of a “great council” (legislative) and the “small council” (executive),—a property qualification being required both for voters and candidates. No canton was to form any political alliances abroad or at home. The “communes” were given larger political rights, the burghers who owned and used the common lands becoming more and more private associations. There was no Swiss burghership, as in 1798, but perfect liberty of settlement in any canton. There were to be no privileged classes or subject lands. A very close alliance with France (on the basis of that of 1516) was concluded. The whole constitution and organization were far better suited for the Swiss than the more symmetrical system of the Helvetic republic, but, as it was guaranteed by Bonaparte, and his influence was predominant, the whole fabric was closely bound up with him, and fell with him. Excellent in itself, the constitution set forth in the Act of Mediation failed by reason of its setting

The pact
of 1815

For ten years Switzerland enjoyed peace and prosperity under the new constitution. Pestalozzi and Fellenberg worked out their educational theories, K. Escher of Zurich embarked the Linth, and was thence called “*von der Linth*”, the central Government prepared many schemes for the common welfare. On the other hand, the mediator (who became emperor in 1804) lavishly expended his Swiss troops, the number of which could only be kept up by a regular blood tax, while the “Berlin decrees” raised the price of many articles. In 1806 the principality of Neuchâtel was given to Marshal Berthier, Tessin was occupied by French troops from 1810 to 1813, and in 1810 Wallis was made into the department of the Simplon, so as to secure that pass. At home, the liberty of moving from one canton to another (though given by the constitution) was, by the diet in 1805, restricted by requiring ten years’ residence, and then not granting political rights in the canton or a right of profiting by the communal property. As soon as Napoleon’s power began to wane (1812–13), the position of Switzerland became endangered. Despite the personal wishes of the czar (a pupil of La Harpe’s), the Austrians, supported by the reactionary party in Switzerland, and without any real resistance on the part of the diet, as well as the Russian troops, crossed the frontier on December 21, 1813, and a few days later the diet was induced to declare the abolition of the 1803 constitution, guaranteed, like Swiss neutrality, by Napoleon. Bern headed the party which wished to restore the old state of things, but Zurich and the majority stood out for the nineteen cantons. The powers exercised great pressure to bring about a meeting of deputies from all the nineteen cantons at Zurich (April 6, 1814, “the long diet”), but party strife was so bitter that many questions had to be referred to the congress sitting at Vienna. The congress decided (March 20, 1815) that Wallis, Neuchâtel, and Geneva should be raised from the rank of “associates” to that of full members of the

confederation (thus making up the familiar twenty-two), and as compensation gave Bern the town of Bienne (Biel) and all (save a small bit which went to Basel) of the territories of the prince-bishop of Basel (“the Bernese Jura”), but the Valtelline was granted to Austria, and Mühlhausen was not freed from France.

The diet accepted this decision, and on August 7, 1815, the new constitution was sworn to by all the cantons save Nidwald, the consent of which was only obtained by armed force, a delay for which she paid by seeing Engelberg and the valley above (acquired by Nidwald in 1798) given to Obwald. By the new constitution the sovereign rights of each canton were fully recognized, and a return made to the lines of the old constitution, though there were to be no subject lands, and political rights were not to be the exclusive privilege of any class of citizens. Each canton had one vote in the diet, where an absolute majority was to decide all matters save foreign affairs, when a majority of three fourths was required. The management of current business, &c., shifted every two years between the Governments of Zurich, Bern, and Lucerne (the three “*Vororte*”). The monasteries were guaranteed in their rights and privileges, and no canton was to make any alliance contrary to the rights of the Confederation or of any other canton. Provision was made for a federal army. Finally the congress, on November 20, 1815, placed Switzerland and parts of North Savoy (Chablais, Faucigny, and part of the Genevois) under the guarantee of the great powers, who engaged to maintain their neutrality, thus freeing Switzerland from her 300 years’ subservience to France, and compensating in some degree for the reactionary nature of the new Swiss constitution when compared with that of 1803.

¶ The cities at once secured for themselves in the cantonal great councils an overwhelming representation over the neighbouring country districts, and the agreement of 1805 as to migration from one canton to another was renewed by twelve cantons. For some time there was little talk of reforms, but in 1819 the Helvetic Society definitely became a political society, and the foundation in 1824 of the Marksmen’s Association enabled men from all cantons to meet together. A few cantons (notably Tessin) were beginning to make reforms, when the influence of the July revolution (1830) in Paris and the sweeping changes in Zurich led the diet to declare (December 27) that it would not interfere with any reforms of cantonal constitutions provided they were in agreement with the pact of 1815. Hence for the next few years great activity in this direction was displayed, and most of the cantons reformed themselves, save the most conservative (*e.g.*, Uri, Glarus) and the advanced who needed no changes (*e.g.*, Geneva, Graubünden). Provision was always made for revising these constitutions at fixed intervals, for the changes were not felt to be final, and seven cantons—Zurich, Bern, Lucerne, Solothurn, St Gall, Aargau, and Thurgau—joined together to guarantee their new free constitutions (Siebener Concordat of March 17, 1832). Soon after, the question of revising the federal pact was brought forward by a large majority of cantons in the diet (July 17), whereon, by the league of Sarnen (November 14), the three Forest cantons, with Neuchâtel, the city of Basel, and Wallis, agreed to maintain the pact of 1815 and to protest against the separation of Basel in two halves (for in the reform struggle Schwyz and Basel had been split up, though the split was permanent only in the latter case). A draft constitution providing for a federal administration distinct from the cantons could not secure a majority in its favour, a reaction against reform set in, and the diet was forced to sanction (1833) the division of

Basel into the "city" and "country" divisions (each with half a vote in the diet), though fortunately in Schwyz the quarrel was healed. Religious quarrels further stirred up strife in connexion with Aargau, which was a canton where religious party prevailed, later in others. In Zurich the extreme pretensions of the radicals and freethinkers (illustrated by offering a chair of theology in the university to Strauss because of his recent *Life of Jesus*) brought about a great reaction in 1839, when Zurich was the "Vorort." In Aargau the parties were very evenly balanced, and, when in 1840, on occasion of the revision of the constitution, the radicals had a popular majority, the aggrieved clerics stirred up a revolt (1840), which was put down, but which gave their opponents (headed by A. Keller) the excuse for carrying a vote in the great council to suppress the eight monasteries in the canton. This was flatly opposed to the pact of 1815, which the diet by a small majority decided must be upheld, though after many discussions it determined (August 31, 1843) to accept the compromise by which four only were to be suppressed, and declared that the matter was now settled. On this the seven Catholic cantons—Uri, Schwyz, Unterwalden, Lucerne, Zug, Freiburg, and Wallis—formed (September 7, 1843) a "Sonderbund" or separate league, which (February 1844) issued a manifesto demanding the reopening of the question and the restoration of all the monasteries. Like the radicals in former years the Catholics went too far and too fast, for in October 1844 the clerical party in Lucerne (in the majority since 1841, and favouring the reaction in Wallis) officially invited in the Jesuits and gave them high posts, an act which created all the more sensation because Lucerne was the "Vorort." Twice (December 1844 and March 1845) parties of Free Lances tried to capture the city. In December 1845 the Sonderbund turned itself into an armed confederation, ready to appeal to war in defence of the rights of each canton. The radicals carried Zurich in 1845 and Bern in 1846, but a majority could not be secured in the diet till Geneva (October 1846) and St Gall (May 1847) were won by the same party. On July 20, 1847, the diet, by a small majority, declared that the Sonderbund was contrary to the federal pact, which on August 16 it was resolved to revise, while on September 3 it was decided to invite each canton to expel the Jesuits. Most of the great powers favoured the Sonderbund, but England took the contrary view. On October 29 the deputies of the unyielding cantons left the diet, which ordered on November 4 that its decree should be enforced by arms. The war was short (November 11-29), mainly owing to the ability of Dufour, and the loss of life trifling. One after another the rebellious cantons were forced to surrender, and, as the Paris revolution of February 1848 occupied all the attention of the great powers (who by the constitution of 1815 should have been consulted in the revision of the pact), the Swiss were enabled to settle their own affairs quietly. Schwyz and Zug abolished their "landsgemeinden," and the seven were condemned to pay the costs of the war (ultimately defrayed by subscription), which had been waged rather on religious than on strict particularist or states-rights grounds. The diet meanwhile debated the draft constitution drawn up by Kern of Thurgau and Druey of Vaud, which in the summer of 1848 was accepted by fifteen and a half cantons, the minority consisting of the three Forest cantons, Wallis, Zug, Tessin, and Appenzell (Inner Rhoden), and it was proclaimed on September 12.

Constitu-
tion of
1848

The new constitution inclined rather to the Act of Mediation than to the system which prevailed before 1798. A status of "Swiss citizenship" was set up, closely joined to cantonal citizenship: a man settling in a canton not

being his birthplace got cantonal citizenship after two years, but was excluded from all local rights in the "commune" where he might reside. A federal or central Government was set up, to which the cantons gave up a certain part of their sovereign rights, retaining the rest. The federal legislature (or assembly) was made up of two houses—the council of states (Stände Rath), composed of two deputies from each canton, whether small or great¹ (44 in all), and the national council (National Rath), made up of deputies (now 145 in number) elected for three years, in the proportion of one for every 20,000 souls or fraction over 10,000, the electors being all Swiss citizens. The federal council or executive (Bundesrath) consisted of seven members elected by the federal assembly, they are jointly responsible for all business, though for sake of convenience there are various departments, and their chairman is called the president of the Confederation. The federal judiciary (Bundesgericht) is made up of eleven members elected by the federal assembly for three years, its jurisdiction is chiefly confined to civil cases, in which the Confederation is a party (if a canton, the federal council may refer the case to the federal tribunal), but takes in also great political crimes,—all constitutional questions, however, being reserved for the federal assembly. A federal university and a polytechnic school were to be founded, the latter only has as yet been set up, and is fixed at Zurich. All military capitulations were forbidden in the future. Every canton must treat Swiss citizens who belong to one of the Christian confessions like their own citizens, for the right of free settlement is given to all such, though they acquired no rights in the "commune." All Christians were guaranteed the exercise of their religion, but the Jesuits and similar religious orders were not to be received in any canton. German, French, and Italian were recognized as national languages.

The constitution as a whole marked a great step forwards, though very many rights were still reserved to the cantons, yet there was a fully organized central government. Almost the first act of the federal assembly was to exercise the power given them of determining the home of the federal authorities, and on November 28, 1848, Bern was chosen, though Zurich still ranks as the first canton in the Confederation.

By this early settlement of disputes Switzerland was protected from the general revolutionary movement of 1848, and in later years her political history has been uneventful, though she has felt the weight of the great European crisis in industrial and social matters.

The position of Neuchâtel, as a member of the Confederation (as regards its government only) and as a principality ruled by the king of Prussia, whose rights had been expressly recognized by the congress of Vienna, was uncertain. She had not sent troops in 1847, and, though in 1848 there was a revolution there, the prince did not recognize the changes. Finally, a royalist conspiracy in September 1856 to undo the work of 1848 caused great excitement and anger in Switzerland, and it was only by the mediation of Napoleon III. and the other powers that the prince renounced (1857) all his rights, save his title, which his successor (the German emperor) has also dropped. Since that time Neuchâtel has been an ordinary member of the Confederation. In 1859-60 the cession of Savoy (part of it neutralized in 1815) to France aroused considerable indignation, and in 1862 the long standing question of frontiers in the Vallée de Dappes was finally arranged.

¹ The method of election and length of term of office were left to the cantonal Governments, at present (1887), in eleven cantons (or half cantons) the people, in fourteen the "great council," elect, twelve elect for one year and twelve for three, Wallis holding to the mean of two years.

with France. In 1871 many French refugees, especially Bourbaki's army, were most hospitably received and sheltered. The growth of the Old Catholics after the Vatican council (1870) caused many disturbances in western Switzerland, especially in the Bernese Jura. The attack was led by Bishop Lachat of Basel, whose see was suppressed by several cantons in 1873. The Old Catholics have been recognized by nine cantons and the see of Basel set up again, though Bern does not recognize it. The appointment by the pope of the abbé Mermillod as "apostolic vicar" of Geneva, which was separated from the diocese of Freiburg, led to Monseigneur Mermillod's banishment from Switzerland (1872), but in 1883 he was raised to the vacant see of Freiburg and allowed by the federal authorities to return, though Geneva still refuses to recognize him. Perhaps the latest event of importance to Switzerland was the opening of the St Gotthard tunnel, which was begun in 1871 and ended in 1880, by it the Forest cantons seem likely to regain the importance which was theirs in the early days of the Confederation.

From 1848 onwards the cantons continually revised their constitutions, always in a democratic sense, though after the Sonderbund War Schwyz and Zug abolished their "landsgemeinde". The chief point was the introduction of the *referendum*, by which laws made by the cantonal legislature may (facultative *referendum*) or must (obligatory *referendum*) be submitted to the people for their approval, and this has obtained such general acceptance that Freiburg alone does not possess the *referendum* in either of its two forms, Tessin having accepted it in its optional form in 1883. It was therefore only natural that attempts should be made to revise the federal constitution of 1848 in a democratic and centralizing sense, for it had been provided that the federal assembly, on its own initiative or on the written request of 50,000 Swiss electors, could submit the question of revision to a popular vote. In 1866 the restriction of certain rights (mentioned above) to Christians only was swept away, but the attempt at final revision in 1872 was defeated by a small majority, owing to the efforts of the anti-centralizing party. Finally, however, another draft was better liked, and on April 19, 1874, the new constitution was accepted by the people—14½ cantons against 7½ (those of 1848 without Tessin, but with Freiburg and Lucerne) and 340,199 votes as against 198,013. This constitution is that now in force, and is simply an improved edition of that of 1848. The federal tribunal (now of nine members only) was fixed (by federal law) at Lausanne, and its jurisdiction enlarged, especially in constitutional disputes between cantons and the federal authorities, though jurisdiction in administrative matters (e.g., educational, religious, election, commercial) is given to the federal council, a division of functions which is very anomalous, and does not work well. A system of free elementary education was set up, and many regulations made on ecclesiastical matters. A man settling in another canton was, after a residence of three months only, given all cantonal and communal rights, save a share in the common property (an arrangement which as far as possible kept up the old principle that the "commune" is the true unit out of which cantons and the Confederation are built), and the membership of the "commune" carries with it cantonal and federal rights. The *referendum* was introduced in its "facultative" form, i.e., all federal laws must be submitted to popular vote on the demand of 30,000 Swiss electors or of eight cantons. If the revision of the federal constitution is demanded by one of the two houses of the federal assembly or by 50,000 Swiss citizens, the question of revision must be submitted to a popular vote, as also the draft of the revised constitution,—these provisions, contained already in the constitution of 1848,

forming a species of "obligatory *referendum*." It was supposed that this plan would lead to radical and sweeping changes, but as a matter of fact there have been (1874–86) about one hundred and seven federal laws and resolutions passed by the assembly, of which nineteen were by the *referendum* submitted to popular vote, thirteen being rejected, while six only were accepted,—the rest becoming law as no *referendum* was demanded. There has been a very steady opposition to all schemes aiming at increased centralization. By the constitutions of 1848 and 1874 Switzerland has ceased to be a mere union of independent states joined by a treaty, and has become a single state with a well organized central Government, to which have been given certain of the rights of the independent cantons, but increased centralization would destroy the whole character of the Confederation, in which the cantons are not administrative divisions but living political communities. Swiss history teaches us, all the way through, that Swiss liberty has been won by a close union of many small states, and we cannot doubt that it will be best preserved by the same means, and not by obliterating all local peculiarities, nowhere so striking and nowhere so historically important as in Switzerland.

Chronological Table of Chief Events

1291	First League of the Three Lands.	1513	The Thirteen complete
1315	Morgarten	1516	Alliance with France
1353	The Eight Orte complete	1531	Kappel
1386	Sempach	1586	Golden League.
1388	Näfels	1648	Formal Freedom from the Empire.
1394	Hapsburgs give up rights	1798	The Helvetic Republic.
1444	St Jakob an der Birs	1803	Act of Mediation—19 Cantons
1474	Everlasting Compact	1815	Federal Pact—22 Cantons.
1478	Granson and Morat.	1847	Sonderbund War
1481	Compact of Stanz.	1848	Federal Constitution
1489	Practical Freedom from the Empire	1874	Revised Constitution

General Authorities—For the early history, the works of Huber, Rilliet, and Von Wyss (see Text) may be consulted, for general political history those of Daguett, Dändliker (large and small versions), Henne am Rhyn, Oechsl, Strickler, Vulliamin, and, for constitutional history, those of Blumer, Bluntschli, Dubs, Meyer, and Orelli. Of those named, the works of Rilliet, Dändliker (the small version), Strickler, Dubs, and Orelli are best suited for foreign readers. Books on local history and on special periods abound, and many very valuable essays are hidden in the publications of the numerous cantonal historical societies. Of modern English works relating to Switzerland the most noteworthy are G. Grolo, *Seven Letters concerning the Politics of Switzerland* [the Sonderbund War of 1847] (originally published 1847, reprinted 1876), and E. A. Freeman, 'Review of Kirk's "Charles the Bold," in *Historical Essays*, first series, 1872, pp. 336–370, and *Historical Geography of Europe*, 1881. The great *Historisch Geographischer Atlas der Schweiz*, by Vögeli, Meyer von Knonau, and Von Wyss (Zürich, 1870), is almost indispensable to any serious student of Swiss history. Garster's small maps are appended to Oechsl's history, and also published separately. (W. A. B. G.)

PART III.—LITERATURE.

It can hardly be said of Switzerland that she possesses a truly national literature. She has a literature in French and a literature in German, but these literatures are not the expression of a common intellectual life, for the German and French cantons have always been to some extent dominated by different ideas and sympathies. Political union has been only in part associated with the deeper union which relates to purely ideal interests. Even the difference between the French and the German literatures of Switzerland does not give a complete conception of the diversity of thought and sentiment which exists in the country. Switzerland has also produced Italian writers and writers who use the Romansch dialect of the Grisons. The Romansch and Italian branches of her literature are not, however, sufficiently important to deserve more than passing notice.

During the struggles against the Hapsburgs the members of the Confederation were too seriously occupied in defending their political rights and in adding to their territory to be very eager for the satisfaction of intellectual needs. They produced some vigorous war songs, but in other respects they were content with such literature as

might happen to reach them from neighbouring countries. At the time of the Reformation there was much intellectual activity in Switzerland, but it related chiefly to the controversy of the Protestants with the Church of Rome, and Zwingli, Bullinger, and the other Reformers of the German cantons were not, like Luther, wise enough to write important treatises in the language of the people. They wrote chiefly in Latin, reserving the use of German for sermons and hymns. One good writer of this period whose interest was not confined to theology was François Bonivard, who, although a native of Savoy, had, as prior of the monastery of St Victor, been associated with Geneva before the Reformation. He was one of the most resolute of those who opposed the ambition of Charles III, duke of Savoy, and it is he whose sufferings in the service of his adopted country have been immortalized by Byron in "The Prisoner of Chillon". After his release from imprisonment he became a Protestant, and wrote in French several important books, the chief of which is his *Chroniques de Genève*. This work is written in a bright and animated style, and is especially valuable for its account of events with which the author himself was connected. Another vigorous writer of the 16th century was Agidius Tschudi, who remained loyal to the Roman Church. He devoted himself with enthusiasm to the study of history. The only result of his labours given to the world in his lifetime was *Die welt wahrhaftig alpine Rhätia*, but several other works have since been published, the most important being his *Chronicon Helveticum* and his *Haupt-schlüssel zu verschiedenen Alterthümern*.

After the Reformation a respect for learning was maintained by the university of Basel, the Carolinum of Zurich, and various other educational institutions in the leading towns of the Confederation, but for a long time Switzerland took little part in the literary movement of Europe. Theology was still generally thought to be the only subject worthy of study by serious minds, and theologians continued to write their books in Latin (as, for example, C. Gessner of Zurich). In this respect their example was followed by men of science. In the few instances in which scholars belonging to German cantons wished to appeal to readers who were not specialists they wrote in French, for Switzerland was so intimately associated in politics with France that the French language was spoken by the educated classes in all parts of the country. French literature was the only modern literature of which they had any real knowledge.

Early in the 18th century there were many signs of an intellectual awakening both in the German and in the French districts. The literary activity manifested in the German cantons was indirectly connected with the fact that they had been gradually acquiring a stronger sense of political independence. They had been alienated from France by the arrogance of the French Government, and had been forced to consider whether it might not be possible for Switzerland to defend her own interests without foreign patronage. Here and there scholars began to interest themselves in Swiss history, and to take pride in the achievements of the forefathers of the republic, and, in proportion as patriotic sentiment increased, thoughtful men became less inclined to take all their ideas from the country to which alone they had hitherto looked for intellectual guidance. They studied with greater earnestness the literatures of Greece and Rome, and some of them turned to English literature, with which they had not up to this time had the slightest acquaintance. These influences gave a powerful impetus to the best aspirations of the German population of Switzerland, and it was not in literature only that important results were achieved. Members of the family of Bernoulli at the university of

Basel had already been doing great work in mathematics and now the fame of Switzerland as a country favourable to the development of science was extended by many investigators, the best known of whom were Euler, Haller, Scheuchzer, and Muralt.

The writer who first gave expression to the most characteristic literary conceptions of his time in Switzerland was J. J. Bodmer, a native of Zurich. He was a good classical scholar, and in youth had made himself familiar with some of the masterpieces of English, French, and Italian literature. In 1721, in association with his friend Breitinger, a learned Protestant clergyman in Zurich, he began to issue the *Discourse des Males*, written in imitation of the style of the English essayists. In this periodical the two friends criticized freely the works of some popular German versifiers, and they wrote with so much force and confidence that they soon exercised considerable influence not only in Switzerland but in Germany. When the value of their work was beginning to be recognized, a high place was taken among German men of letters by Gottsched, a professor at Leipsic. He was an ardent admirer of the classic drama of France, and gathered around him a number of enthusiastic disciples, known as the Saxon school. For some time he was on friendly terms with the Swiss critics with whom he agreed in condemning the wild extravagance of Lohenstein and his imitators. But when Bodmer and Breitinger went on to praise English literature, and to call attention especially to the splendid qualities of Milton, Gottsched denounced their opinions as utterly false and misleading. The result was that a bitter controversy broke out between the Saxon and Swiss schools, Bodmer and Breitinger presenting an elaborate statement of critical doctrine, the former in *Vom Wunderbaren in der Poesie* (1740), the latter in *Kritische Dichtkunst* (1740). The controversy was followed with great interest by many readers, and, although it was by and by almost forgotten, it helped to prepare the way for the outburst of German literature begun by Klopstock, Wieland, and Lessing. The theories of all the combatants were to some extent crude and even grotesque, but Bodmer and Breitinger did excellent service by the vigour with which they protested against the notion that poetry is merely the work of the understanding acting in subjection to rigid rules, and by their enthusiastic appreciation of great English writers. Bodmer also opened fresh sources of inspiration by editing a part of the *Nibelungenlied* and some poems of the Minnesinger,—undertakings in which he anticipated the labours of the Romantic school. He wrote an epic, the *Noachide*, and several dramas, but his work as a poet is feeble and unimportant in comparison with his achievements as an editor and critic.

A. von Haller, who made his fame chiefly as a man of science (see vol. xi p. 396), ranked in literature also among the foremost men of his day. His poems are too directly didactic to give much pleasure to modern readers, but in some of them—especially *Die Alpen*—there are passages of striking force and beauty. Haller knew the Alps not merely from books but by having visited them, and to him belongs the credit of having revealed that they appeal powerfully to the imagination, and of having associated them with great thoughts and aspirations. He wrote several prose romances, but outside of Switzerland these works, which had many readers at the time of their publication, are now practically forgotten.

A Swiss writer of the 18th century who, as a poet, Gessner became more famous even than Haller was Solomon Gessner. At Berlin and Hamburg he came under the influence of Ramler and Hagedorn, and after his return to his native town Zurich, where he lived as an artist, he published a series of idyllic poems which excited universal

admiration The most popular of his writings was his prose idyl, *Der Tod Abels* (1758) This work was translated into many languages, and was received with not less favour in Germany, France, and England than in Switzerland. There is not much serious thought in Gessner's works, and his sentiment sometimes degenerates into sentimentalism, but a permanent place is secured for him in literature by his simple, lucid style and by the delicate grace of his sketches of ideal scenery These qualities were warmly appreciated by Lessing and afterwards by Goethe

Salis-Seewis Of the German Swiss poets who were born after Gessner had become famous the best were J G Salis-Seewis and J M Usteri Salis Seewis was acquainted with Goethe, Schiller, Herder, and Wieland, but he was not so much influenced by them as by a greatly inferior poet, Matthäson, whose ideas and methods closely resembled his own There is little variety of sentiment in the poems of Salis-Seewis, but their uniformity of tone is prevented from being tiresome by his perfect sincerity and by the vividness of his diction Usteri wrote at least one song—"Freut euch des Lebens"—which became popular among Germans of all classes, but his most important writings were some clever stories in the German dialect of Zurich.

Philosophy, in the strict sense of the term, was not profoundly studied in the German cantons in the 18th century, but philosophical problems, especially those relating to ethics, were discussed in a popular style by a good many more or less able writers Of these writers one of the most renowned was J G Zimmermann. His chief writings are *Ueber die Einsamkeit* (1755) and *Vom Nationalstolz* (1758) These works present a strange combination of cynicism and sentimentalism, but they profoundly impressed Zimmermann's contemporaries, and were translated into most European languages J G Sulzer spent the greater part of his life in Berlin, where he was held in much esteem at the time when Lessing was beginning to make a name as a critic and dramatist His principal work is his *Allgemeine Theorie der schönen Künste*, in which he tried to present a complete exposition of the laws of art, starting with the philosophical principles of Wolf, and combining them with critical doctrines derived from English and French writers His style is somewhat cold and formal, and to later generations his governing thoughts have seemed meagre and unfruitful H K Hürzel wrote *Das Bild eines wahren Patrioten* (1767) and various other works, in which he displayed a considerable power of expounding and illustrating great moral principles. He is remembered chiefly, however, by a charming description which he wrote of a day spent by Klopstock and himself with some friends on the Lake of Zurich,—a day celebrated by Klopstock in one of the finest of his early odes J K Lavater made some reputation as a poet, but he owed his fame chiefly to his *Physognomische Fragmente* (1775-78), in which he sought to develop the idea that the face presents a perfect indication of character, and that physiognomy may therefore be treated as a science His notions are arbitrary and rather mystical, but he expressed them with so much vigour and enthusiasm that he found many admirers and disciples J H Pestalozzi was a less pretentious but infinitely more useful writer than Lavater Early in life, mainly through the influence of Rousseau, he became impressed by the necessity of a radical change in the methods of popular education, and with splendid self-sacrifice he devoted his energies to the task of realizing his ideas and of inspiring others with a sense of their importance. His writings—of which *Lienhard und Gertrud* is the best—are not distinguished by any remarkable literary qualities, but his theories made his name famous all over the civilized world, and children in every good school may still be said to profit indirectly by his labours.

In the 18th century the German cantons produced many writers on historical subjects One of the most distinguished of them was I. Iselin, who, in his *Geschichte der Menschheit* (1768), offered suggestions akin to those which were afterwards set forth with wider knowledge and deeper insight by Herder J H Tschudi and J J Tschudi, The descendants of Aegidius Tschudi, also did much good work as historians Greater than any of these—the foremost historical writer of Switzerland—was J von Muller, whose Muller writings marked an era in German literature His masterpiece is his *Geschichte der schweizerischen Eidgenossenschaft* (1780) Muller had not an adequate appreciation of the laws of evidence in historical inquiry, but he was indefatigable in research, and no German historian of his time had so great a power of bringing out the significance of facts by his method of grouping them. His style, although sometimes obscure and rhetorical, was often made warm and glowing by his eager love of freedom and justice

The literary movement of the French districts in the 18th century had little direct relation with that of the German cantons. It sprang chiefly from the influence of French refugees, who flocked in great numbers to western Switzerland after the revocation of the edict of Nantes The most energetic of the French writers of Switzerland in the first half of the 18th century was Bourguet, the son of Bourguet. a refugee He travelled in Italy and Holland, and on his return to Geneva founded the *Bibliothèque Italique*, which appeared from 1729 to 1734 In carrying on this periodical, which extended to eighteen volumes, Bourguet was aided by a good many Swiss writers—among others by Abraham Ruchat and Loys de Bochat of Lausanne Bourguet's colleagues also contributed articles to French periodicals of a similar kind in Holland, three of which—the *Bibliothèque Universelle et Historique*, the *Bibliothèque Choise*, and the *Bibliothèque Ancienne et Moderne*—were conducted by Jean le Clerc, a native of Geneva In 1732 Bourguet started at Neuchâtel the *Meurce Suisse*, which went on until 1784 and did much to stimulate the interest of its readers in science, literature, history, and archaeology The indefatigable editor and his colleagues did not confine themselves to journalistic work One of his books—*Traité des Pétrifications*—was an important contribution to geology, and Loys de Bochat wrote a careful book entitled *Mémoires Critiques sur l'Histoire Ancienne de la Suisse* Ruchat was the author of *Histoire de la Réformation de la Suisse* and of *Délices de la Suisse* The writings of J P Crousaz de Crousaz, a friend of Bourguet, display no remarkable qualities, but two of them, his *Examen* of Pope's *Essay on Man* and his *Commentaire* on the same poem, have some interest for English readers An English translation of the *Examen* by Mrs Elizabeth Carter was published in 1739, and led to the intervention of Warburton, who considered it necessary to prove that the *Essay* was not in any way hostile to religion.

During the second half of the 18th century all Europe was reading the works of a Swiss writer, by far the most illustrious man of letters whom Switzerland has produced—J J Rousseau. He moved civilized mankind by many a doctrine which no one now holds to be true, but he owed his astonishing influence not so much to his fallacies as to his passionate zeal for the rights of the poor, to his enthusiasm for the free development of individual character, and to the power with which he reflected in his writings the beauty and the splendour of the external world. Of his own happiness he made shipwreck, but, if we judge his work simply by the practical results which sprang from it, he was perhaps the greatest literary force of modern times. His family was of French origin, but it had been so long settled at Geneva that it had become thoroughly Swiss, and to this fact were due some of the

most striking characteristics of his genius. Free and republican Switzerland was the only Continental country whose institutions were favourable to the growth of the ideas with which Rousseau shook to its centre the political and social system of the 18th century

Saussure Of the other French writers of Switzerland in this age the most eminent was perhaps H B de Saussure, who, in his *Voyages dans les Alpes* (1776-79), presented in a lucid and attractive style the results of much careful observation. He was one of the founders of geology, and made important contributions to several other sciences. Another distinguished scientific writer of this time was Charles Bonnet, the author of several valuable works on natural history and psychology. His general conception of the order of the world he developed systematically in his *Contemplation de la Nature* (1764). Much good work was also done by the brothers De Luc, one of whom, Jean-André de Luc, gave in *Lettres sur Quelques Parties de la Suisse* (1787) a very vivid picture of the physical, social, and political peculiarities of a portion of Switzerland.

Some clever books were written by Madame de Charrière, a native of Utrecht, who settled with her husband in the principality of Neuchâtel in 1771. Much interest was excited by her lively *Lettres Écrites de Lausanne* and by her *Lettres Neuchâteloises*, and both in Switzerland and in France there were many admirers of her *Mari Sentimental* and of the corresponding work *Lettres de Mistress Henley*. Samuel Constant, the father of Benjamin Constant, wrote *Camille* and some other romances in the form of letters, and *Contes Moraux*, in the style of Marmontel, were written by J Senebier, who did better work as an investigator in physics and physiology.

In the second half of the 18th century there were in French Switzerland many ardent students of history. One of the ablest of them was P H. Mallet, who took as his special subject the antiquities of northern Europe, but wrote also works on the general history of Denmark, Brunswick, and Hesse. Béranger was the author of a *Histoire de Genève*, and Lambert, who had served as secretary of several legations in Holland and Germany, brought together in his *Mémoires* many interesting details about events of which he had personal knowledge. A good history of Switzerland to the 17th century was written by De Watterville, and Philibert dealt with the same subject in a work entitled *Les Révolutions de la Haute-Allemagne*, in which he brought the story down to 1468. G E von Haller wrote several excellent historical works, the most important of which was his *Bibliothek der Schweizergeschichte*.

From the latter part of the 18th century onwards French Switzerland has produced many influential writers, but they have been so intimately connected with France that their works properly belong to French literature. Necker, who played so great a part in France before the Revolution, was one of the greatest writers of his age on politics and finance, and his daughter Madame de Stael, whom, although she was born in Paris, Switzerland may also claim, stands in the front rank of women who have devoted themselves to literature. Her most brilliant work, *Corinne*, was, perhaps of less real importance than *De l'Allemagne*, from which Frenchmen obtained for the first time authentic information as to the intellectual development of Germany. Benjamin Constant wrote a work on the source, forms, and history of religion, he was also the author of *Adolphe*, a romance, and adapted Schiller's *Wallenstein* for the French stage. But his principal work is the collection of his *Discours Prononcés à la Chambre des Députés*, in which he eloquently defends, from many points of view, the principles of constitutional government. De Sismondi dis-

played astonishing energy as a writer on history, literature, and political economy, and it is still necessary for students of the subjects on which he wrote to consult his works. His *Histoire des Français*, although planned on too vast a scale, is a wonderful monument of industry, learning, and literary skill, and not less valuable in their own way are his *Histoire de la Renaissance de la Liberté en Italie* and his *De la Littérature du Midi de l'Europe*. A Vinet, an eminent Protestant theologian, produced a great impression by his *Discours sur Quelques Sujets Religieux* and various other theological works, which are full of vigorous thought expressed in a clear, direct, and manly style. Among Swiss novelists R Topffer, author of *L'Héritage*, *Traversée*, and many other works, takes a distinguished place. His early writings attracted the attention of Goethe, who read them with pleasure, and Sainte-Beuve, in praising Topffer's methods, gave utterance to the general opinion of educated Frenchmen. The three brothers André, Antoine Elisée, and The Joel Cherbuliez, and their sisters Adrienne and Madame Cherbuliez, were all well known writers, and Victor Cherbuliez, the son of André, is one of the brightest and most fertile novelists of the present day in France. He commands respect also as a writer on politics.

In the later literature of the German cantons there are not so many famous names as in the later literature of the French cantons. Of a group of writers who connected the influences of the 18th century with those of the 19th, J Albertin B Albertini was the most original, but he appealed to a comparatively small class. He was a bishop in the church of the Moravian Brethren, and his poems give powerful expression to the deeply religious sentiment of his sect. A romance by J C Appenzeller—*Gertrud von Wart Appenzeller* (1813)—was so popular that it was translated into French, Dutch, and English, but it has not maintained the high place which was for some time attributed to it. J R Wyss edited the *Alpenrosen* from 1811 for about twenty years, and for this periodical he wrote many poems, taking his subjects chiefly from Swiss history and legends. He completed and published a story begun by his father, *Der Schweizerische Robinson*, translations of which have been widely circulated in France, Spain, England, and America. He also wrote "Rufst du, mein Vaterland," the great national song of Switzerland. A E Fröhlich was a good Fröhlich writer of fables, and J A Henne made a considerable Henne reputation, not only as a poet but as the writer of a work entitled *Manethos, die Origines unserer Geschichte und Chronologie*, in which he sought to prove the European origin of the Aryan race. T Meyer-Merian, author of the well-known song, "Ich ging so ganz alleine," was also a vigorous dramatist. Dramatic and lyrical poems of some power were written by T Bornhauser, but they were too plainly intended to serve a political party to have permanent significance. A more poetical writer was B Reber, whose *Bilder aus den Burgunder-Kriegen* present a series of glowing pictures from one of the most splendid periods of Swiss history.

All these writers were surpassed by Albert Bitzius, known as Jeremias Gotthelf from the title of his first book. He was the vicar of Lutzelfluh, and for many years found ample scope for his energies in quiet works of benevolence. *Der Bauerspiegel, oder Lebensgeschichte des Jeremias Gotthelf*, published in 1836, when he was nearly forty years of age, at once made his name famous, and it was followed by *Uli der Knecht*, *Uli der Pächter*, *Leiden und Freuden eines Schulmeisters*, and other powerful tales. The charm of his writings springs from the fact that they are an accurate representation of the thoughts, feelings, and habits of the people among whom he laboured. Bitzius was a man of an ardent and impulsive temper, but a close observer, capable of penetrating far below the

surface of life, and endowed with a remarkable faculty of reproducing his impressions in striking imaginative pictures. His style is often rough and careless, but his artistic defects are never serious enough to interrupt the free development of his fresh and vivid conceptions.

Keller

Another German writer of Switzerland whose name is well known beyond the limits of his own country is Gottfried Keller. He established his reputation by his

romance *Der Grüne Heinrich* (1854), and afterwards he published *Die Leute von Seldwyla*, a series of tales of village life, and *Sieben Legenden*. He is also the author of some volumes of poems.

SWORD *Origins and Early Forms*—The sword is a hand weapon of metal, distinct from all missile weapons on the one hand, and on the other hand from staff-weapons, —the pike, bill, halberd, and the like,—in which the metal head or blade occupies only a fraction of the effective length. The handle of a sword provides a grip for the hand that wields it, or sometimes for two hands, it may add protection, and in most patterns does so to a greater or less extent. But it is altogether subordinate to the blade. For want of a metal headed lance or axe, which indeed were of later invention, a sharpened pole or a thur-edged paddle will serve the turn. A sword-handle without a blade is naught, and no true sword blade can be made save of metal capable of taking an edge. There are so-called swords of wood and even stone to be found in collections of savage weapons. But these are really flattened clubs, and the present writer agrees with Gen. Pitt Rivers in not believing that such modifications of the club have had any appreciable influence on the form or use of true swords. On this last point, however, the opinions of competent archaeologists are so much divided that it must be regarded as fairly open. We will only remark that the occurrence in objects of human handwork of a form, or even a series of forms, intermediate between two types is not conclusive evidence that those forms are historical links between the different types, or that there is any historical connexion at all. In the absence of dates fixed by external evidence this kind of comparison will seldom take us be-

yond plausible conjecture. A traveller who had never seen velocipedes might naturally suppose, on a first inspection, that the tricycle was a modification of the old four-wheeled velocipede, and the bicycle a still later invention, he would perhaps regard the two wheeled "Otto" as the historical link between tricycles and bicycles. But we know that in fact the order of development has been quite different.

It is more difficult as a matter of verbal definition to distinguish the sword from smaller hand-weapons. Thus an ordinary sword is four or five times as long as an ordinary dagger, but there are long daggers and short swords, neither will the form of blade or handle afford any certain test. The real difference lies in the intended use of the weapon, we associate the sword with open combat, the dagger with a secret attack or the sudden defence opposed to it. One might say that a weapon too large to be concealed about the person cannot be called a dagger. Again, there are large knives, such as those used by the Afridis and Afghans, which can be distinguished from swords only by the greater breadth of the blade as compared with its length. Again, there are special types of arms, of which the yataghan is a good example, which in their usual forms do not look much like swords, but in others that occur must be classed as varieties of the sword, unless we keep them separate by a more or less artificial theory, referring the type as a whole to a different origin.

Of the actual origin of swords we have no direct evidence. Neither does the English word nor, so far as

we are aware, any of the equivalent words in other languages, Aryan or otherwise, throw any light on the matter. We only know that swords are found from the earliest times of which we have any record among all people who have acquired any skill in metal-work. There are two very ancient types, which we may call the straight-edged and the leaf-shaped. Assyrian monuments represent a straight and narrow sword, apparently better fitted for thrusting than cutting. Bronze swords of this form have actually been found in Etruscan tombs, and by Dr Schliemann at Mycenæ, side by side with leaf-shaped specimens. We have also from Mycenæ some very curious and elaborately wrought blades, so broad and short that they must be called ornamental daggers rather than swords. The leaf-shaped blade is common everywhere among the remains of men in the "Bronze Period" of civilization, and

FIG. 1—1-5 Greek swords of the classical type (Gerhard's *Griechische Vasenbilder*). 6-15, Roman swords from Lindenschmidt, *Tracht und Bewaffnung des römischen Heeres während der Kaiserzeit*, Brunswick, 1882. 6, So-called "sword of Tiberius" from Mainz (Brit. Mus.). 7, Bonn (private collection), length 765 mm. 8, legionary (monument at Wiesbaden). 9, cavalry (monument at Mainz). 10, cavalry (monument at Worms). 12, 13, sword handles (hilt and Mainz). 11, 14, 15, from Trajan's column.

this was the shape used by the Greeks in historical times, and is the shape familiar to us in Greek works of art. It is impossible, however, to say whether the Homeric heroes wore the leaf-shaped sword, as we see it, for example, on the Mausoleum sculptures, or a narrow straight-edged blade of the Assyrian-Mycenæan pattern. In any case, the sword holds a quite inferior position with Greek warriors of all times. We have not the means of pronouncing which pattern is the older. To a modern eye the Assyrian or Mycenæan sword looks fitter for thrusting than cutting. The leaf-shaped sword, so far as we know from works of art, was used with a downright cutting blow, regardless of the consequent exposure of the swordsman's body, this, however, matters little when defence is left to a shield or armour, or both. The use of the sword as a weapon of combined offence and defence—swordsmanship as we now

understand it—is quite modern. If the sword was developed from a spearhead or dagger, one would expect it to have been a thrusting weapon before it was a cutting one. But when we come to historical times we find that the effective use of the point is a mark of advanced skill and superior civilization. The Romans paid special attention to it, and Tacitus tells us how Agricola's legionaries made short work of the clumsy and pointless arms of the Britons when battle was fairly joined.¹ The tradition was preserved at least as late as the time of Vegetius, who, as a technical writer, gives details of the Roman soldier's sword exercise. Asiatics to this day treat the sword merely as a cutting weapon, and most Asiatic swords are incapable of being handled in any other way.

Historical Types.—The normal types of swords which we meet with in historical times, and from which all forms now in use among civilized nations are derived, may be broadly classified as straight-edged or curved. In the straight-edged type, in itself a very ancient one, either thrusting or cutting qualities may predominate, and the blade may be double-edged or single-edged. The double-edged form was prevalent in Europe down to the 17th century. The single edged blade, or backsword as it was called in England, is well exemplified in the Scottish weapons commonly but improperly known as claymores, and is now exclusively employed for military weapons. But these, with few exceptions, have been more or less influenced by the curved Oriental sabre. Among early double-edged swords the Roman pattern stands out as a workmanlike and formidable weapon for close fight, the point was used by preference. In the Middle Ages the Roman tradition disappeared, and a new start was made from the clumsy barbarian arm which the Romans had despised. Gradually the broad and all but pointless blade was lightened and tapered, and the thrust, although its real power was unknown, was more or less practised. St Louis anticipated Napoleon in calling on his men to use the point, and the heroes of dismounted combats in the *Morte d'Arthur* are described as "foining" at one another. In the first half of the 16th century a well-proportioned and well-mounted cut-and-thrust sword was in general use, and great artistic ingenuity was expended, for those who could afford it, on the mounting and adornment. The growth and variations of the different parts of the hilt, curiously resembling those of a living species, would alone be matter enough for an archaeological study. One peculiar form, that of the Scottish basket-hilt, derived from the Venetian pattern known as *schavone*, has persisted to our own day without material change.

Quite different from the European models is the crescent-shaped Asiatic sabre, commonly called scimitar. We are not acquainted with any distinct evidence as to the origin of this in time or place. The fame of the Damascus manufacture of sword-blades is of great antiquity, as is also that of Khorásán, still the centre of the best Eastern work of this kind. Whoever first made these blades had conceived a very definite idea,—that of gaining a maximum of cutting power regardless of loss in other qualities,—and executed it in a manner not to be improved upon. The action of the curved edge in delivering a blow is to present an oblique and therefore highly acute angled section of the blade to the object struck, so that in effect the cut is given with a finer edge than could safely be put on the blade in its direct transverse section. In a well-made sabre the setting of the blade with regard to the handle ("leading forward") is likewise ordered with a view to this result. And the cutting power of a weapon so shaped and mounted is undoubtedly very great. But

¹ Agric., 36. "Britannorum gladii sine mucrone complexum armorum et in aperto pugnum non tolerabant."

the use of the point is abandoned, and the capacities of defensive use (to which Orientals pay little or no attention) much diminished. These drawbacks have caused the scimitar type, after being in fashion for European light cavalry during the period of Napoleon's wars and somewhat longer, to be discarded in our own time. But, as long as Easterns adhere to their rigid grasp of a small handle and sweeping cut delivered from the shoulder, the Persian scimitar or Indian talwar will remain the natural weapon of the Eastern horseman. Indian and Persian swords are often richly adorned but their appropriate beauty is in the texture of the steel itself, the "damascening" or "watering" which distinguishes a superior from a

FIG. 2.—Oriental swords (reproduced by permission from *Encyclopædia Britannica*, 11th ed., 1911). 1, 2, Decorated Persian arms; 3, common type of talwar (North West Provinces); 4, common type of talwar (North West Provinces); 5, yataghan type; 6, Persian sword; 7, 8, 9, 10, Mahratta, showing transition to gauntlet sword.

common specimen. This process, long obscure to Europeans, has in recent times been explained (see below).

There are special Asiatic varieties of curved blades of which the origin is more or less uncertain. Among these the most remarkable is perhaps the yataghan, a weapon pretty much coextensive with the Mohammedan world, though it is reported to be not common in Persia. It has been imported from Africa, through a French imitation, as the model of the sword-bayonets which have been common for about a generation in European armies, probably the French authorities caught at it to satisfy the sentiment which lingered in Continental armies long after it had disappeared in England, that even the infantry soldier after the invention of the bayonet must have some kind of

sword. A compact and formidable hand-weapon has thus been turned into a clumsy and top-heavy pike. If we try to make a bayonet that will cut cabbages, we may or may not get a useful chopper, but we shall certainly get a very bad bayonet. The double curve of the yataghan is substantially identical with that of the Goorkha knife (*kuñri*), though the latter is so much broader as to be more like a woodman's than a soldier's instrument. It is doubtful, however, whether there is any historical connexion. Similar needs are often capable of giving rise to similar inventions without imitation or communication. There are yet other varieties, belonging to widely spread families of weapons, which have acquired a strong individuality. Such are the swords of Japan, which are the highly perfected working out of a general Indo-Chinese type; they are powerful weapons and often beautifully made, but a European swordsman would find them ill-balanced and clumsy, and the Japanese style of sword-play certainly has nothing to teach us.

Other sorts of weapons, again, are so peculiar in form or historical derivation, or both, as to refuse to be referred to any of the normal divisions. The long straight gauntlet-hilted sword (*patā*) found both among the Mahrattas in the south of India, and among the Sikhs and Rajputs in the north, is an elongated form of the broad-bladed dagger with a cross-bar handle (*katār*), as is shown by a transitional form, much resembling in shape and size of blade the mediæval English anlace, and furnished with a guard for the back of the hand. This last-mentioned pattern seems, however, to be limited to a comparatively small region. When once the combination of a long blade with the gauntlet hilt was arrived at, any straight blade might be so mounted, and many appear on examination to be of European workmanship—German, Spanish, or Italian. There are various other Oriental arms, notably in the Malay group, as to which it is not easy to say whether they are properly swords or not. The Malay "parang latok" is a kind of elongated chopper sharpened by being bevelled off to an edge on one side, and thus capable of cutting only in one direction. The anlace incidentally mentioned above seems to be merely an overgrown dagger; the name occurs only in English and Welsh, in which language first, or whence the name or thing came is unknown (see *Philol. Soc. Dict.*, s.v.).

Modern European Developments.—In the course of the 16th century the straight two-edged sword of all work was lengthened, narrowed, and more finely pointed, till it became the Italian and Spanish rapier, a weapon still furnished with cutting edges, but used chiefly for thrusting. We cannot say how far this transition was influenced by the *estoc*, a mediæval thrusting weapon carried by horsemen rather as an auxiliary lance than as a sword. The Roman preference of the point was rediscovered under new conditions, and fencing became an art. Its progress was from pedantic complication to lucidity and simplicity, and the fashion of the weapon was simplified also. Early in the 18th century, the use of the edge having been finally abandoned in rapier-play, the two-edged blade was supplanted by the bayonet-shaped French duelling sword, on which no improvement has since been made except in giving it a still simpler guard. The name of rapier is often but wrongly given to this by English writers. About the same time, or a little earlier, the primacy of the art passed from Italy to France, and there it still remains. It would take us too far to consider the history of fencing here; Mr Egerton Castle's work will be found a trustworthy guide, and almost indispensable for those who wish really to understand the passages relating to sword-play in our Elizabethan literature, of which the fencing scene in *Hamlet* is the most famous and obvious example.

There are plenty of modern books on sabre-play, but comparatively little attention has been given to its scientific treatment. It is said that the Italian school is better than the French, and the modern German and Austrian the best of all. Some of the English cavalry regiments have good traditions, enriched of late years by the application of a knowledge of fencing derived from eminent French masters.

The best Eastern blades are justly celebrated, but they are not better than the best European ones, in fact, European swords are often met with in Asiatic hands, remounted in Eastern fashion. The "damascening" or "watering" of choice Persian and Indian arms is not a secret of workmanship, but is due to the peculiar manner of making the Indian steel itself, in which a crystallizing process is set up, when metal of this texture is forged out, the result is a more or less regular wavy pattern running through it. No difference is made by this in the practical qualities of the blade.

Archæology and General History.—R. F. Burton *The Book of the Sword* (only one vol. published), London, 1884. Colonel Lano Fox (now Major Gen Pitt Rivers), *Catalogue of Anthropological Collection South Kensington Museum*, London 1874. 'Primitive Warfare' in *Journal of the Royal United Service Institution*, 1867, 1868, 1869. For special regions and periods, see Hon. W. H. Murray, *Illustrated Handbook of Indian Arms*, published by the India Office, London 1880. Lindenschmit *Tracht und Bewaffnung des römischen Heeres während der Kaiserzeit*, Brunswick 1882. Drummond and Anderson, *Ancient Scottish Weapons* Edinburgh and London, 1881. The more general treatises and handbooks on arms and armour, such as Grose, Meyrick, Hewitt, Lacombe, Pemplin, may be consulted with advantage but are not always to be trusted in detail. "The Forms and History of the Sword" in *Proceedings of the Royal Institution*, 1883, by the present writer, gives further references and citations on various points.

various points

Swordsmanship—*Fighting Castle Schools and Masters of Fence from the Middle Ages to the Eighteenth Century* London 1880 (including a critical bibliography). Vigorant, *Bibliographie de l'Escrime Ancienne et Moderne* Paris 1887. Gouard (assumed name of Possellier) *Theorie de l'Escrime* Paris 1841 (historical introduction). Grisey *Les Armes et le Duel* Paris, 1847 (preface by A. Dumas). Chapman *Foil Practice* London 1811. *Notes and Observations on the Art of Fencing* 1864. J. M. Walte, *Lessons in Sabre, &c.*, London [1881]. The French official *Manuel d'Escrime* (approved 1877) gives a very clear and concise summary of the modern school. Cordolani's *Léçons d'Armes* (Paris, 1877, 2d ed.) and Camille Prévost's *Théorie Pratique de l'Escrime* (Paris 1886) are the latest and best treatises on the small sword. There is forthcoming in England in the "Balminton Series" a work on Fencing by W. H. L. Jolyet and I. Crawford-Crue to which is added *Bibliotheca Armi Dum cariora, a Corp etc and General History of the Art of Fence*, by F. Gerton Castle.

such bounds as not to interfere with the effective use of the point. An eccentric specialized variety—we may call it a “sport”—of the sabre is the narrow and flexible “schlager” with which German students fight their duels (for the most part not arising out of any quarrel, but set trials of skill), under highly conventional rules almost identical with those of the old English “backswording” practised within living memory, in which, however, the swords were represented by sticks. These “schlager” duels cause much effusion of blood, but not often serious danger to life or limb.

SWORD-FISH. Sword-fishes are a small family of spiny rayed fishes (*Xiphiidae*), the principal characteristic of which consists in the prolongation of the upper jaw into a long pointed sword like weapon. The "sword" is formed by the coalescence of the intermaxillary and maxillary bones, which possess an extremely hard texture, it has the shape of a much elongate cone, more or less flattened throughout its whole length, the end is sharply pointed. It is smooth above and on the upper part of the sides, and rough below owing to the presence of innumerable rudimentary teeth, which have no function.

The general form of the body is well proportioned, somewhat elongate, and such as is always found in fishes with great power of swimming, as, for instance, in the mackerel and tunny, and the tail

Sword Fish
(*Histiophorus pulchellus*)

terminates in a powerful bilobed caudal fin. A long fin occupies nearly the whole length of the back, whilst the anal fin is generally interrupted in the middle, and consequently appears to be double. The skin is very firm, partly naked, partly with small lanceolate scales deeply imbedded in the skin. The teeth of the lower jaw are, like those of the upper, merely rudimentary structures, which render the surface of the bone rough without possessing any special function.

Sword fishes have been divided into three generic groups —

a *Histiophorus*, with a high dorsal fin which can be spread out like a sail, and with ventral fins which are reduced to a pair of long styliiform appendages

b *Tetrapturus*, with a dorsal fin of which the anterior rays only are elongate, the remainder of the fin being low or partly obsolete, and with styliiform ventral fins as in the preceding genus

c *Xiphus*, with the dorsal fin shaped as in *Tetrapturus*, but without ventral fins.

Sword fishes are truly pelagic fishes, which either singly or in pairs or in smaller or larger companies roam over the oceans of the tropical and subtropical zones of both hemispheres. Some species wander regularly or stray far into the temperate seas. Some of the tropical forms are the largest of Acanthopterygian fishes, and not exceeded in size by any other Teleostean, such species attain to a length of from 12 to 15 feet, and swords have been preserved more than 3 feet long and with a diameter of at least 3 inches at the base. The *Histiophori*, which inhabit chiefly the Indo-Pacific Ocean, but occur also in the Atlantic, seem to possess in their high dorsal fin an additional aid for locomotion. During the rapid movements of the fish this fin is folded downwards on the back, as it would impede the velocity of progress by the resistance it offers to the water, but, when the fish is swimming in a leisurely way, it is frequently seen with the fin erected and projecting out of the water, and when quietly floating on the surface it can sail by the aid of the fin before the wind, like a boat.

The food of the sword-fishes is the same as that of tunnies, and consists of smaller fish, and probably also in great measure of pelagic cuttle-fishes. It has been ascertained by actual observation that sword-fishes procure their food by dashing into a school of fishes, piercing and killing a number of them with their swords, and this kind of weapon would seem to be also particularly serviceable in killing large cuttle-fish, like the saw of saw-fishes, which is used for the same purpose. But the swords of the large species of *Histiophorus* and *Tetrapturus* are, besides, most formidable weapons of aggression. These fishes never hesi-

tate to attack whales and other large cetaceans, and, by repeatedly stabbing them, generally retire from the combat victorious. That they combine in these attacks with the thresher shark is an often repeated story which has its foundation in the imagination of the observer, and which is fully disproved by the fact that the dentition of the thresher-shark is much too weak to make an impression on the skin of any cetacean. The cause which excites sword-fishes to such attacks is unknown, but they follow the instinct so blindly that they not rarely assail boats and ships in a similar manner, evidently mistaking them for cetaceans. They easily pierce the light canoes of the natives of the Pacific islands and the heavier boats of the professional sword-fish fishermen, often dangerously wounding the persons sitting in them. Attacks by sword-fishes on ocean going ships are so common as to be included among sea risks. They are known to have driven their weapon through copper sheathing, oak-plank, and timber to a depth of nearly 10 inches, part of the sword projecting into the inside of the ship, and the force required to produce such an effect has been described by Prof Owen in a court of law as equal to "the accumulated force of fifteen double handed hammers," and the velocity as "equal to that of a swivel-shot," and "as dangerous in its effects as a heavy artillery projectile." Among the specimens of planking pierced by sword-fishes which are preserved in the British Museum there is one less than a foot square which encloses the broken ends of three swords, as if the fishes had had the object of concentrating their attack on the same vulnerable point of their supposed enemy. The part of the sword which penetrates a ship's side is almost always broken off and remains in the wood, as the fish is unable to execute sufficiently powerful backward movements to free itself by extracting the sword.

In the Mediterranean and on the Atlantic coasts of the United States the capture of sword-fishes forms a regular branch of the fishing industry. The object of the fishery in the Mediterranean is the common European sword-fish (*Xiphus gladius*), the average weight of which is about one cwt., and which is abundant off the Sicilian coasts and on the opposite coast of Calabria. Two methods are employed,—that by harpoons, chiefly used for larger fish, and that by peculiarly constructed nets called *palamitare*. This fishery is very productive, a company of fishermen frequently capture from twenty to fifty fish in a single day, and the average annual catch in Sicily and Calabria is reported to be 140,000 kilogrammes (136 tons). The products of the fishery are consumed principally in a fresh state, but a portion is preserved in salt or oil. The flesh of the sword-fish is much preferred to that of the tunny, and always commands a high price. This species is occasionally captured on the British coast.

On the coast of the United States a different species, *Histiophorus gladius*, occurs, it is a larger fish than the Mediterranean sword-fish, attaining to a length of from 7 to 12 feet, and an average weight of 300 or 400 lb. It is captured only by the use of the harpoon. From forty to fifty vessels, schooners of some 50 tons, are annually engaged in this fishery, with an aggregate catch amounting annually to about 3400 sword-fishes, of a value of \$45,000. The flesh of this species is inferior in flavour to that of the Mediterranean species, and is principally consumed after having been preserved in salt or brine.

Useful and detailed information on the sword fish fishery can be obtained from A. T. Tozzetti, "La Pesca nei Mari d'Italia e la Pesca all'Estero esercitata da Italiani," in *Catalogo Esposizione Internazionale di Pesca in Berlino*, 1880, also from *La Pesca del Pesci Spada nello Stretto di Messina* (Messina, 1880), and from G. Brown Goode, "Materials for a History of the Sword fish," in *Report of the Commissioner of Fish and Fisheries*, part viii., Washington, 1883. (A. C. G.)

SYBARIS, a city of Magna Græcia, on the Gulf of Tarentum, between the rivers Crathus (Crati) and Sybaris (Cosile), which now meet 3 miles from the sea, but anciently had independent mouths, was the oldest Greek colony in this region. It was an Achaean colony founded by Iuss of Helice (720 B.C.), but had among its settlers many Troezenians, who were ultimately expelled. Placed in a very fertile, though now most unhealthy, region, and following a liberal policy in the admission of citizens from all quarters, the city became great and opulent, with a vast subject territory and divers daughter colonies even on the Tyrrhenian Sea (Posidonia, Laus, Scidrus). For magnificence and luxury the Sybarites were proverbial throughout Greece, and in the 6th century probably no Hellenic city could compare with its wealth and splendour. At length contests between the democrats and oligarchs, in which many of the latter were expelled and took refuge at Crotona, led to a war with that city, and the Crotonians with very inferior forces were completely victorious. They razed Sybaris to the ground and turned the waters of Crathus to flow over its ruins (510 B.C.). Explorations undertaken by the Italian Government in 1879 have failed to lead to a precise knowledge of the site.

SYDENHAM, a suburb of London, in the county of Kent, is finely situated chiefly on elevated ground about 7 miles south of Charing Cross, London. There is railway communication by the London, Brighton, and South Coast, the Mid Kent branch of the South-Eastern, and the London, Chatham, and Dover lines. Formerly Sydenham was a small hamlet of Lewisham, which rose into favour from its sylvan beauty, its pleasant situation, and its medicinal waters. These springs were discovered in 1640 on Sydenham common. The quality of the water resembled that of Epsom, and was regarded as efficacious in scorbutic and paralytic affections. After the construction of a railway the suburb grew into high repute as a residence, especially for the wealthier commercial and professional classes. The construction of the Crystal Palace (see *London*, vol. vii. p. 836) in 1854 greatly aided the prosperity of Sydenham, although the building is not within its boundaries. There is a public lecture hall and literary institute at Sydenham Hill, and a school of art, science, and literature in connexion with the Crystal Palace. The charitable institutions include a home and infirmary for sick children and the South London dispensary for women. The population of the township (area, 1623 acres) was 19,065 in 1871, and 26,076 in 1881.

SYDENHAM, THOMAS (1624-1689), "the English Hippocrates," was born at Winford Eagle in Dorset in 1624, where his father was a gentleman of property and good pedigree. At the age of eighteen he was entered at Magdalen Hall, Oxford, after two years his college studies appear to have been interrupted, and he served for a time as an officer in the army of the Parliament. He completed his Oxford course in 1648, graduating as bachelor of medicine, and about the same time he was elected a fellow of All Souls College. It was not until nearly thirty years later (1676) that he graduated as M.D., not at Oxford, but at Pembroke Hall, Cambridge, where his eldest son was then an undergraduate. His interest in medicine seems to have been aroused at an early age. Nothing is known of Sydenham's life between 1648 and 1663, but it is probable that he spent part of the time at Oxford. It is said also (on the authority of one Desault, in a work published at Bordeaux in 1733) that he studied at Montpellier, although it is not so stated by himself in his

dedicatory letter to Dr Mapletoft, among the other autobiographical facts there given. In 1663 he passed the examinations of the College of Physicians for their licence to practise in Westminster and 6 miles round, but it is probable that he had been settled in London for some time before that. This minimum qualification to practise was the single bond between Sydenham and the College of Physicians throughout the whole of his career. He seems to have been distrusted by the heads of the faculty because he was an innovator and something of a plain-dealer. In his letter to Mapletoft he refers to a class of detractors "qui vitio statim vertunt si quis novum aliquid, ab illis non prius dictum vel etiam inauditum, in medium proferat", and in a letter to Robert Boyle, written the year before his death (and the only authentic specimen of his English composition that remains), he says, "I have the happiness of curing my patients, at least of having it said concerning me that few miscarry under me, but [I] cannot brag of my correspondence with some other of my faculty. Though yet, in taking fire at my attempts to reduce practice to a greater easiness, plainness, and in the meantime letting the mountebank at Charing Cross pass unrailed at, they contradict themselves, and would make the world believe I may prove more considerable than they would have me." Sydenham attracted to him in warm friendship some of the most discriminating men of his time, such as John Locke and Robert Boyle. His first book, *Methodus Curandi Febres*, was published in 1666, a second edition, with an additional chapter on the plague, in 1668, and a third edition, much enlarged and bearing the better-known title of *Observationes Medicae*, in 1676. His next publication was in 1680 in the form of two *Epistolae Responsoriae*, the one, "On Epidemics," addressed to Brady, regius professor of physic at Cambridge, and the other, "On the Lues Venerea," to Paman, public orator at Cambridge and Gresham professor in London. In 1682 he issued another *Dissertatio Epistolariæ*, on the treatment of confluent smallpox and on hysteria, addressed to Dr Cole of Worcester. The *Tractatus de Podagra et Hydropoe* came out in 1683, and the *Schedula Monitoria de Novæ Febris Ingressu* in 1686. His last completed work, *Processus Integri*, is an outline sketch of pathology and practice, twenty copies of it were printed in 1692, and, being a compendium, it has been more often republished both at home and abroad than any other of his writings separately. A fragment on pulmonary consumption was found among his papers. His collected writings occupy about 600 pages 8vo in the original Latin.

Hardly anything is known of Sydenham's personal history in London. He died in an acute paroxysm of gout in December 1689. He was buried in the church of St James's, Piccadilly, where a mural slab was put up by the College of Physicians in 1810.

Although Sydenham was a highly successful practitioner and saw more than one new edition of his various tractates called for, besides foreign reprints, in his lifetime, his fame as the father of English medicine, or the English Hippocrates, was decidedly posthumous. For a long time he was held in vague esteem for the success of his cooling (or rather expectant) treatment of smallpox, for his laudanum (the first form of a tincture of opium), and for his advocacy of the use of Peruvian bark in quartan agues. There were, however, those among his contemporaries who understood something of Sydenham's importance in larger matters than details of treatment and pharmacy, chief among them being the talented Morison. But the attitude of the academical medicine of the day is doubtless shown forth in Lister's use of the term "sectaries" for Sydenham and his admirers, at a time (1694) when the leader had been dead five years. If there were any doubt that the opposition to him was quite other than political, it would be set at rest by the testimony of Dr Andrew Brown,¹ who went from Scotland to inquire into Sydenham's practice, and has incidentally revealed

¹ See Dr John Brown's *Novæ Subsecræ*, art. "Dr Andrew Brown and Sydenham."

what was commonly thought of it at the time, in his *Indicatory Schedule concerning the New Cure of Fevers*. In the series of Harveian orations at the College of Physicians, Sydenham is first mentioned in the oration of Arbuthnot (1727), who styles him "emulus Hippocritis." Boerhaave, the Leyden professor, was wont to speak of him in his class (which had always some pupils from England and Scotland) as "Anglus inmen, artis Phœbum, verum Hippocratici viri speciem." Haller also marked one of the epochs in his scheme of medical progress with the name of Sydenham. He is indeed famous because he inaugurated a new method and a better ethics of practice, the worth and diffusive influence of which did not become obvious (except to those who were on the same line with himself, such as Morton) until a good many years afterwards. It remains to consider briefly what his innovations were.

First and foremost he did the best he could for his patients, and made as little as possible of the mysteries and traditional dogmas of the craft. All the stories told of him are characteristic. Called to a gentleman who had been subjected to the lowering treatment, and finding him in a pitiful state of hysterical upset, he "conceived that this was occasioned partly by his long illness, partly by the previous evacuations, and partly by emptiness. I therefore ordered him a roast chicken and a pint of canary." A gentleman of fortune who was a victim to hypochondria was at length told by Sydenham that he could do no more for him, but that there was living at Inverness a certain Dr Robertson who had great skill in cases like his, the patient journeyed to Inverness full of hope, and, finding no doctor of the name there, came back to London full of rage, but cured withal of his complaint. Of a piece with this is his famous advice to Blackmore. When Blackmore first engaged in the study of physic he inquired of Dr Sydenham what authors he should read, and was directed by that physician to *Don Quixote*, "which," said he, "is a very good book, I read it still." There were cases, he tells us, in his practice where "I have consulted my patient's safety and my own reputation most effectually by doing nothing at all." It was in the treatment of small pox that his startling innovations in that direction made most stir. It would be a mistake, however, to suppose that Sydenham wrote no long prescriptions, after the fashion of the time, or was entirely free from theoretical bias. Doctrines of disease he had, as every practitioner must have, but he was too much alive to the multiplicity of new facts and to the infinite variety of individual constitutions to aim at symmetry in his theoretical views or at consistency between his practice and his doctrines, and his treatment was what he found to answer best, whether it were *secundum artem* or not. His fundamental idea was to take diseases as they presented themselves in nature and to draw up a complete picture ("Irankheitsbild" of the Germans) of the objective characters of each. No forms of ill health, he insisted, had a definite type, comparable to the types of animal and vegetable species. The conformity of type in the symptoms and course of a malady was due to the uniformity of the cause. The causes that he dwelt upon were the "evident and conjunct causes, or, in other words, the morbid phenomena, the remote causes he thought it vain to seek after. Acute diseases, such as fevers and inflammations, he regarded as a wholesome conservative effort or reaction of the organism to meet the blow of some injurious influence operating from without, in this he followed the Hippocratic teaching closely as well as the Hippocratic practice of watching and aiding the natural crises. Chronic diseases, on the other hand, were a depraved state of the humours mostly due to errors of diet and general manner of life, for which we ourselves were directly accountable. Hence his famous dictum "*acutus dico, qui ut plurimum Deum habent anthorem, sicut chronici ipsos nos.*" Sydenham's nosological method is essentially the modern one, except that it wanted the morbid anatomy part, which was first introduced into the "natural history of disease" by Morgagni nearly a century later. In both departments of nosology, the acute and the chronic, Sydenham contributed largely to the natural history by his own accurate observation and philosophical comparison of case with case and type with type. The *Observationes Medice* and the first *Epistola Responsoria* contain evidence of a close study of the various fevers, fluxes, and other acute maladies of London over a series of years, their differences from year to year and from season to season, together with references to the prevailing weather,—the whole body of observations being used to illustrate the doctrine of the "epidemic constitution" of the year or season, which he considered to depend often upon inevitable telluric causes. The type of the acute disease varied, he found, according to the year and season, and the right treatment could not be adopted until the type was known. There had been nothing quite like this in medical literature since the Hippocratic treatise, *Περί αέρος, υδατος, πυρός*, and there are probably some germs of truth in it still undeveloped, although the modern science of epidemiology has introduced a whole new set of considerations. Among other things Sydenham is credited with the first diagnosis of scarlatina and with the modern definition of cholera (in *Sched. Vind.*). After smallpox, the diseases to which he refers most are hysteria and gout, his description of the latter

(from the symptoms in his own person) being one of the classical pieces of medical writing. While Sydenham's "natural history" method has doubtless been the chief ground of his great posthumous fame, there can be no question that another reason for the admiration of posterity was that which is indicated by R. G. Latham, when he says, "I believe that the moral element of a liberal and candid spirit went hand in hand with the intellectual qualifications of observation, analysis, and comparison."

The most critical biography is that by Dr R. G. Latham prefixed to his translation of Sydenham's *Works* (2 vols., London 1848, Syd. Soc.). Dr John Brown's "Locke and Sydenham, in *Horæ Sub. caræ*, Edinburgh, 1858, is more of the nature of eulogy. Many collected editions of his works have been published, as well as three English translations. Dr W. A. Greenhill's Latin text (London, 1844, Syd. Soc.) is a model of editing and indexing. There have been foreign monographs on Sydenham by Goeden (Berlin 1827), Rovers (Dort, 1833), F. Jahn (Eisenach, 1840), and Hvasser (Upsala, 1846). The most interesting summary of doctrine and practice by the author himself is the introduction to the 3d ed. of *Observationes Medice* (1676). (C. C.)

SYDNEY, the capital of New South Wales, and the oldest city in Australia, is situated on the east coast of that island-continent in 33° 51' 41" S lat and 151° 12' 23" 25 (10h 4m 49 55s) E long. It lies on the southern shore of the magnificent harbour of Port Jackson, which in 1770 was named, though not discovered, by Captain Cook. He anchored and landed in Botany Bay, about 6 miles to the south, and on afterwards coasting to the north noted what looked like an inlet, to which he gave the name of Port Jackson, after Sir George Jackson, one of the secretaries to the admiralty. It may seem strange that so careful an observer as Cook should have passed close to one of the finest harbours in the world without recognizing its capacity, but the cliffs which guard the entrance are 300 feet in height, and no view of the landlocked basin can be seen from the masthead. Middle Head, which is posted right opposite the entrance, closes it in, and it is necessary to enter, turn to the south, and then to the west before the best part of the harbour discloses itself. This topographical peculiarity gives to the port its great shelter. When in 1788 Captain Phillip arrived at Botany Bay with the first convict fleet, he found its shallow waters and flat shores unsuited for the purposes of a settlement. Strangely enough he was also deterred by the want of water, yet it is on that very shore that the pumping-engine is situated by which Sydney has been supplied for many years. Going northwards, he turned in to examine Port Jackson inlet. Thither the fleet was instantly removed, and Sydney was founded, and Australian colonization started, on 26th January 1788. Captain Phillip's choice of a site was determined by the existence of fresh water in a small stream running into Sydney Cove.

FIG 1.—Harbour and environs of Sydney

The port is flanked on both sides by a number of promontories—its characteristic feature—so that in addition to a broad central channel with deep water there is both on the north and the south side a series of sheltered bays with good anchorage. The entrance is a mile wide, with a minimum depth of 15 fathoms. Some little distance inside is a rock awash, known as the Sow and Pigs, between which and the nearest headlands on either side is an inner bar, with 20 feet of water at low tide, through this bar on the southern side a ship channel has been dredged giving 27 feet of water at neap tide. On the southern side there occur in succession Watson's Bay, Rose

Bay, Double Bay, Rushcutter's Bay, Woolloomooloo Bay, Farm Cove, Sydney Cove, Darling Harbour, Johnstone's Bay, Blackwattle Bay, Iron Cove, Five Dock Bay, Hen and Chickens Bay, besides smaller inlets. On the northern side, beginning again at the Heads, there are North Harbour, Middle Harbour (with many subsidiary inlets), Chowder Bay, Sirius Cove, Mossman's Bay, Shell Cove, Neutral Bay, Careening Cove, Lavender Bay, Berry's Bay, Brill's Head Bay, Lane Cove, Tarban Creek, and other small bays. All these promontories and coves give a length of water frontage which is estimated at not less than 110 miles. Besides these, Botany Bay, though shallow and exposed and destitute of promontories, has a coastline of about 18 miles. Into it debouches George's river,

which is navigable to Liverpool, a distance of 14 miles from the mouth, and in which are several capacious bays. The metropolitan area of Sydney really consists of a peninsula about 13 miles in length, lying between Parramatta and George's rivers. The sea frontage of this area, from the South Head of Port Jackson to the North Head of Botany Bay, is 12 miles in length, and consists alternately of bold cliffs and beautiful beaches. Two of the latter—Bondi and Coogee—are connected with the city by tramways, and are favourite places of holiday resort. Sydney occupies, therefore, a position enjoying singular natural advantages. The city proper, as subsequently determined, takes in the water frontage from the head of Rushcutter's Bay on

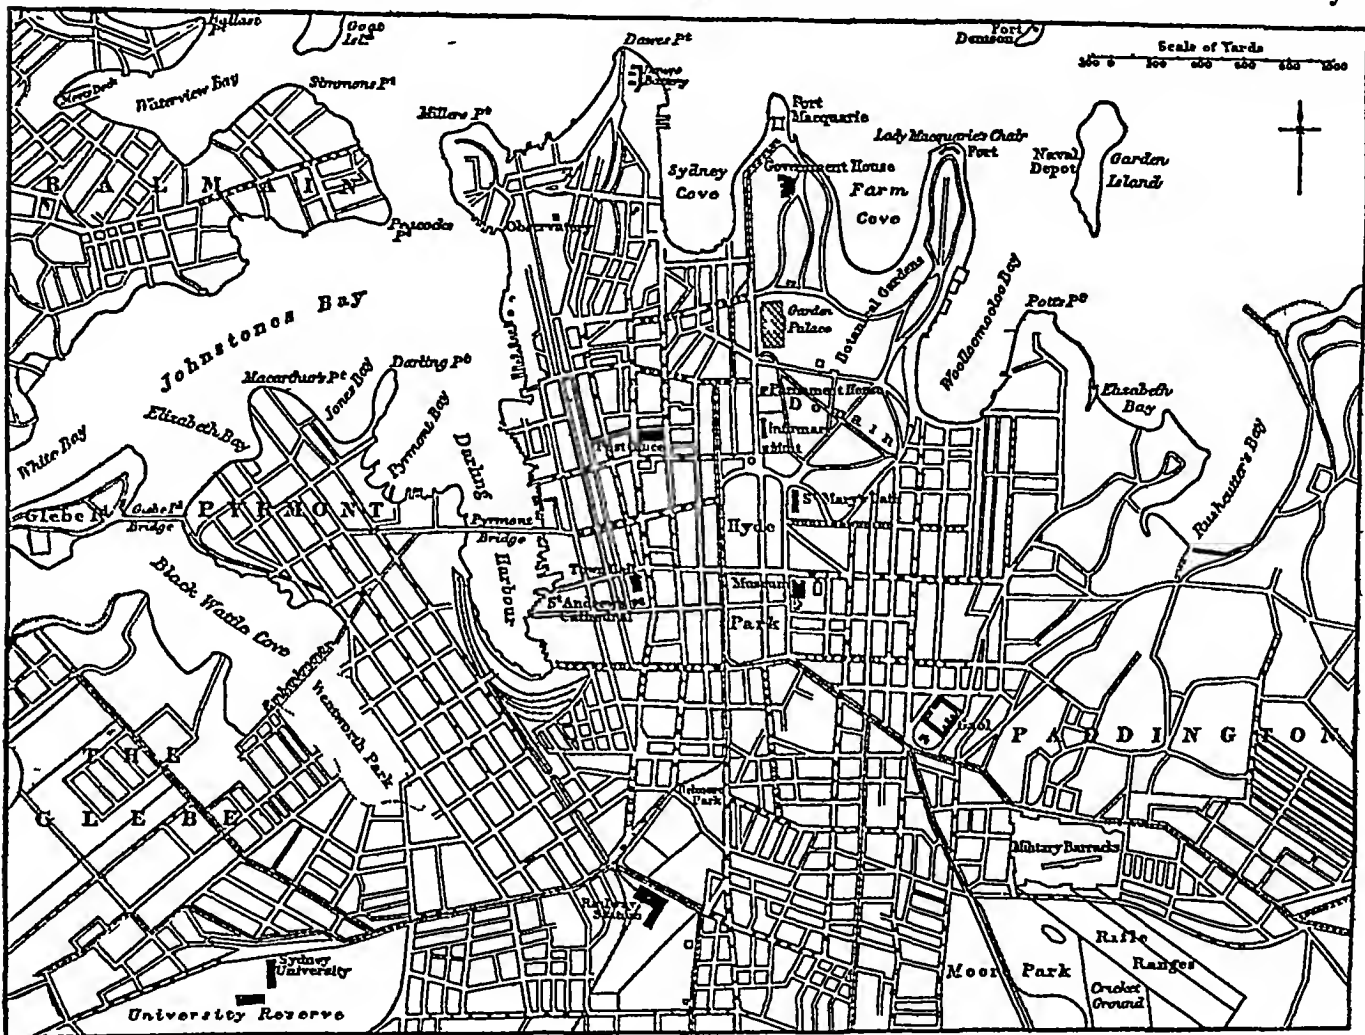

FIG 2.—Map of Sydney

the east to the head of Blackwattle Bay on the west, giving a shore-line of 8 miles, of which $1\frac{1}{2}$ are the frontage of the Domain and Botanic Gardens. The remainder is occupied for commercial purposes, and is held partly by the Government and partly by private owners. There are three large public wharfs—one, known as Circular Quay, embracing the greater part of Sydney Cove, seven-eighths of a mile in length, the second at the head of Darling Harbour, a quarter of a mile in extent, and the third at the head of Woolloomooloo Bay. The rest is occupied by private wharfs, the principal of which are on the east shore of Darling Harbour. A project is on foot for the resumption of the whole by the Government, and the making of a uniform quay, with a railway and a new street. The area of the city is 2670 acres, of which no part is more than a mile and a quarter distant from the water, whilst the average distance is three-quarters of a mile. The surface contour is undulating, the maximum

elevation being 230 feet and the average 120. The soil is sandstone, covered more or less with shaly clay. Of the city area about 800 acres are devoted to public use. The largest reserve is Moore Park, lying to the south-east of the city, nearly 500 acres in extent—originally a waste of sandhills. On it are the rifle range, the Agricultural Society's showground, and the principal cricket ground. The Inner and Outer Domains on the shore of the harbour contain about 130 acres. The former contains Government House, with its private garden and paddocks, the Outer Domain is a public park. The beautiful botanic gardens occupy the shore-line of Farm Cove, commanding the man-of-war anchorage. Hyde Park, the original race-course of the city, is about 49 acres in extent. At the north entrance is a statue of Prince Albert, and on its most elevated part is one of Captain Cook. Prince Alfred Park, on the southern boundary of the city, originally called Cleveland Paddocks, occupies nearly

18 acres, and in it is the original exhibition building, now much used for concerts and festive gatherings. Belmore Park occupies 10 acres, and Cook and Phillip Parks each about the same area. The Fort Phillip reserve is a sort of acropolis, two of its rocky sides being escarped. Here, at an elevation of 146 feet, stands the astronomical observatory. Grose Farm, on the south-west of the city, was the site of one of the earliest attempts at Government farming. It is an undulating and elevated piece of land, and is divided amongst the university and the affiliated colleges of St Paul, St John, and St Andrew, the Prince Alfred Hospital, and Victoria Park.

The city started from the banks of the Tank stream at the head of Sydney Cove, and the chief business part is still in the limited area lying between Darling Harbour and the Domain and Hyde Park. The streets are irregular in width, some of them narrow and close together, while those leading down to Darling Harbour have a steep incline. Sydney has consequently more the look of an Old World city than any other in Australia, and in its lack of spacious promenades and open squares and places, and in its poor opportunity for displaying its public buildings, it contrasts unfavorably with the more symmetrically planned sister cities of Australia. On the other hand, it has a charm which is all its own, as the glimpses of the harbour and the shipping obtainable from so many points give a delightful variety to the street vistas. The principal business street is George Street, 2 miles long, flanked with hand some commercial buildings. In this street are the post office, the town hall, the cathedral, and the main railway station. Only second in importance is Pitt Street, which runs nearly parallel with it as far as the railway station.

The public and private buildings of Old Sydney are of a primitive order of architecture, but they are rapidly disappearing as the city is being rebuilt. With the exception of Government House, the university and affiliated colleges, and the registrar general's office, all the non ecclesiastical public buildings are in a classical style. Of the modern public buildings the museum, the post office, the offices for the colonial secretary, the minister for public works, and the minister for lands, and the custom house are the finest. The town hall is a fine building, but a little too florid, the great hall, when finished, will be the largest in Australia. The Anglican cathedral in George Street is small. A Roman Catholic cathedral, on the east side of Hyde Park, replaces an earlier one that was burnt down, and will, when completed, be the finest ecclesiastical edifice in the city. The mint (an adaptation of an old hospital) is an imperial establishment, the cost of which is defrayed by the colonists. The annual value of the coinage from local gold is about £500,000, and this coinage has imperial currency. All the large public buildings are constructed of Sydney sandstone, which is abundant in quantity, though variable in quality. The best comes from the quarries in Pyrmont.

The length of streets, lanes, and public ways is about 100 miles. These are mostly macadamized, but wood paving has lately come much into favour. The salpards for cattle and sheep (area 40 acres) are 7 miles off, at Homebush. The gross city revenue from all sources is about £376,000. For municipal purposes the city is divided into eight wards, each returning three aldermen, and for parliamentary purposes into three electorates—east, west, and south—each returning four members. In 1881 the city population was 105,000. It was in 1886 officially estimated at 125,000. The population of the suburbs was officially estimated in 1884 at 150,000, making a total metropolitan population of 275,000. Communication with the suburbs is maintained to a large extent by steam tramways, entirely in the hands of the Government. The whole district between Sydney and Parramatta is practically suburban for 2 miles on each side of the railway. The fashionable suburbs lie to the east of Sydney, the business extension of the city being more to the westward. The southern side is largely devoted to manufacturing operations, and population is rapidly extending in the direction of Botany Bay. The north shore of the harbour is outside the city limits, and the communication is by steam ferries. The north shore has deep water close in shore, but little level ground, the land rising rapidly to an elevation of 300 feet. Up this ascent the Government has constructed a cable tramway, and from the railway between Newcastle and Sydney, which crosses the Parramatta river 2 miles below the head of the navigation, there is to be a branch line of railway to the north shore, opposite the city. Water was at first obtained from the so-called Tank stream,

¹ Paddington forms practically an eastern suburb of Sydney, with which there is constant omnibus communication. Victoria barracks are situated within its boundaries. Paddington is inhabited chiefly by the better classes, and possesses a number of public and private schools. A municipal constitution was granted it in April 1860. The population of the borough in 1881 was 9608.

afterwards recourse was had to a lagoon on the southern slope of the dividing ridge between Port Jackson and Botany Bay, from which an artificial tunnel, known as Busby's Bore, brought the water into the city at the level of Hyde Park. When a further supply was wanted the same watercourse was utilized, the works being constructed at the point where it flowed into Botany Bay. A scheme is now (1886) in course of execution to bring water from the Upper Nepean, at a point 63 miles from Sydney. Two streams running in deep sandstone gorges are connected by a tunnel, and their united waters are brought in an open conduit. From the nature of the ground no large reservoir is possible near its source, but about 15 miles from Sydney, at Prospect, near Parramatta, a dam thrown across a valley makes a storage reservoir that will hold a year's supply. From that point the water is taken by open canal and piping to the existing reservoir in Crown Street, the limited area at a higher level being supplied by pumping. The delivery into the city will be over 150,000,000 gallons daily, and the cost of the whole works will exceed £1,500,000.

The old system of sewerage having several outfalls along the city front proved so objectionable that a new system has been designed, and is in course of execution, whereby the harbour will be preserved from all pollution. A great drain is carried from the city to the ocean at a projecting headland north of Bondi Bay, known as Ben Buckler, where the sewage will go at once into deep water with a southerly current. The mouth of the sewer, though exposed to the beat of the ocean in very heavy weather, is 6 feet above high water mark, and from that point it rises with a uniform inclination of 1 in 100, and in a nearly straight line, for a distance of 4 miles 25 chains. This main sewer, which throughout is one continuous monolith in concrete, passes in tunnels under the rocky ridges, and on concrete arches across the intervening flats. It diminishes in size from 8½ by 7½ feet to 5 feet 1 inch by 4 feet 1 inch, and at the upper end it bifurcates to accommodate two separate districts. It is of an oblate, oval form section, as nearly circular as is consistent with a minimum velocity of 2½ feet a second. It drains an area of 4282 acres, and is calculated to discharge all the sewage when this area is populated as thickly as London, together with half an inch of rain per day. The bulk of the storm water is to pass off by surface drains. The sewage of the zone of land along the foreshore is to be lifted into the main sewer. From the southern slope of Sydney another large sewer runs southwards, and, crossing the mouth of Cook's River by a siphon, discharges its contents upon a sandy peninsula well suited for the purpose of a sewage farm.

The jurisdiction of the port of Sydney is in the hands of a marine board, of which three members are elected by the shipping interest, and three others and the president are nominated by the Government. They have the control of the pilot service, which is entirely a Government department. A new lighthouse has recently been erected on the South Head cliff, fitted with a powerful electric light, which is visible 27 miles off. The quarantine ground on North Head is isolated from the adjacent watering place of Manly Beach by a fence and a broad belt of uncultivated land. Ships in quarantine anchor in a sheltered position off the beach, where a hospital ship is also stationed.

Port Jackson being the chief naval depot of Australasia and the headquarters of the admiral's station, the fortifications of the harbour have engaged the attention of successive Governments. The inner line of defence constructed by Sir William Denison has been superseded by more elaborate works. On the north side of the harbour Middle Head, Georges Head, and Bradley's Head have powerful guns which cross fire with those on the South Head, completely commanding the entrance to the channel. There is also a very effective torpedo service. Garden Island, off the mouth of Woolloomooloo Bay, has been handed over to the imperial Government as a naval depot, the man of war anchorage is close under its lee, and the colonial Government has constructed all necessary wharfs and store houses. There is a Government dock at Cockatoo Island capable of accommodating the largest vessels, with a machine-shop close by. Adjoining this a new dock is being hewn out of the sandstone 600 feet in length and 108 feet wide, the depth of water over the sill at spring tide is to be 32 feet, and at neap tide 29 feet 6 inches, and the width at the entrance 84 feet. Mort's Dock and Engineering Company have a large dock at Waterview Bay capable of taking in all the ordinary mail steamers. There is also a patent slip, which can take up vessels of 1000 tons, and a second is in course of construction for vessels of 1500 tons. The graving-dock is 410 feet long. Besides these, there are other smaller patent slips, and a floating dock for the accommodation of smaller craft.

Sydney is in the centre of a great coal-basin, the eastern part of which is supposed to be under the sea, whether a workable seam exists under the city itself, and, if so, at what depth, is at present undetermined, borings of 2000 feet having as yet failed to strike the coal. The seams crop out at Lake Macquarie, north of Sydney, and dip to the south, they also rise to the surface at the south of Sydney, where they dip to the north. Twenty-four miles south of Sydney the seam has been found at a depth of 850 feet, and at

about the same distance to the north at a depth of 600 feet. Coal is also brought into the city by railway from the Blue Mountains and from the Mittagong district, but it is inferior in quality to that mined on the coast.

The abundance and cheapness of coal, as well as the natural and commercial advantages of Sydney, have been favourable to certain lines of manufacturing industry, notwithstanding the high price of labour. In addition to the industries connected with shipping, those connected with the pastoral industry have also been developed, such as tanning, glue making, meat preserving, &c. The large railway works have, under the patronage of the Government, led to the manufacture of locomotives, and nearly all the rolling stock is made in the colonies. Omnibuses, cabs, carriages, buggies, drays, and carts are made in every variety and of excellent quality, as is also harness. Bootmaking is an extensive business, there are also manufactories of tobacco, sugar, kerosene, spirits, beer, tweed, paper, furniture, glass, pottery, and stoves, as well as a great variety of minor industries.

Public schools abound, with merely nominal fees. There is a high school for boys and girls. The grammar-school, with an attendance of 400 boys, receives from Government £1500 a year, with the free use of the buildings. To the handsome university buildings a medical school is now being added. The great hall is the finest Gothic building in Australasia. The university is a teaching as well as examining institution, degrees being given in the four faculties of arts, medicine, law, and science. The university, which is governed by a senate elected by the graduates, has a Government endowment of £12,000 a year, and has been enriched by several donations and bequests (amounting to £250,000, of which about £180,000 by Mr Challis). To it are attached three denominational affiliated colleges, one belonging to the Anglican Church, one to the Roman Catholic, and one to the Presbyterian, to each the Government contributed the land, £10,000 towards the building fund, and an annual stipend of £500 a year for the principal. Technical education is conducted under the auspices of a board supported entirely at the cost of the Government. The pupils already number more than a thousand, and the attendance at the classes is steadily increasing. There is a good school of arts, with 400 members, and a good circulating library. The public free library is supported by the Government, and to it is attached a lending branch. The Royal Society has a roll of 500 members, meets periodically for the reading and discussion of scientific papers, publishes its transactions, and has a small library. The Linnæan Society is also well supported, and a Geographical Society has lately been started. The museum, in College Street, is managed by trustees and supported wholly at the cost of the Government. There is a small museum attached to the university, to which Mr Macleay has bequeathed his collection, which is especially rich in natural history.

Sydney has many charitable institutions. It has three hospitals, the newest and largest, which is close to the university, having been built after the best European models. There are three large lunatic asylums in the suburbs, the latest is on the pavilion principle. The benevolent asylum, which is mainly supported by the Government, gives a large amount of outdoor assistance, takes in all waifs and strays, and acts as a lying-in hospital. Old men are provided for in an institution at Liverpool. At Randwick is an asylum for destitute children, which receives a large amount of Government support, and there are two orphan asylums at Parramatta, but the state children are now being boarded out under the auspices of a Government board. There are two soup kitchens and refuges, supported by private contributions, and also a charity organization society. There is a home visiting and relief society, intended principally for those who have known better days, and a prisoners' aid society, besides numerous friendly societies. All the churches are well represented, and to each is attached one or more charitable agencies.

The climate of Sydney is mild and moderately equable. It resembles closely the climate of Toulon. The mean temperature is 62° 6 Fahr and the extreme range of the shade thermometer is from 106° to 36° Fahr. The sea breeze which prevails during the summer comes from the north-east, and, while it tempers the heat, makes the air moist and induces languor. In winter the prevailing wind is from the west, and the air is dry and bracing. The annual rainfall is 50 inches. The hot north-west wind of summer sometimes sends the humidity down below 30°, and once it has been as low as 16°. In the cool westerly winds of winter it seldom falls to 55°, and never below 45°. The average humidity for the year is 74°. The mean tide is 3 feet 3 inches. (A. GA.)

SYENE (Asw(N) See EGYPT, vol. vii p. 783

SYENITE See GRANITE, vol. xi p. 49

SYLBURG, FRIEDRICH (1536-1596), an eminent Greek scholar, and one of the greatest figures in the annals of German philology, was the son of a farmer, and was born at Wetter near Marburg in 1536. Wetter had then an ex-

cellent school, taught by J. Focmhus and Justus Vultcius, and Sylburg also got help in his studies from the preacher J. Püntier, whose daughter he subsequently married. His studies were continued at Marburg and Jena, and then at Geneva (1559) and at Paris. Here his teacher was Henry Estienne (Stephens), to whose great Greek *Thesaurus* Sylburg afterwards made important contributions. Returning to Germany, he was for a time a schoolmaster at Neuhaus near Worins, and then head of a new gymnasium at Lich, where he edited a useful edition of Nicolas Cleynart's *Greek Grammar* (Frankfort, 1580), which was thrice reprinted during his lifetime. But the period of his important literary labours began when (having previously, in 1581, declined a call to the Greek chair at Marburg) he resigned his post at Lich and moved to Frankfort to act as corrector and editor of Greek texts for the enterprising publisher J. Wechel. To his Frankfort period belong the editions of Pausanias (1583), Herodotus (1584), Dionysius of Halicarnassus (2 vols, 1586—one of his best pieces of work), Aristotle (5 vols, 1587—dedicated to the landgraves of Hesse, from one of whom, Louis IV, he received a pension), the Greek and Latin sources for the history of the Roman emperors (3 vols, 1589-90), and the *Περὶ συντάξεως* of Apollonius. In 1591 he was attracted to Heidelberg by the treasures of the library, not yet scattered by the Thirty Years' War. Here he became librarian to the elector palatine, and was untiring in collecting further MS treasures. At the same time the series of editions, which Wechel had begun to find too costly, was continued by the Heidelberg publisher Hieronymus Commelinus. At Heidelberg were printed Clement of Alexandria (1592), Justin Martyr (1593), the *Etymologicum Magnum* (1594), the *Scriptores de Re Rustica* (1595), the Greek gnomic poets (1596), Xenophon (1596), Nonnus (1596), and other works. All Sylburg's editions show great critical power and indefatigable industry. Indeed he wore himself out with work, and died on 16th February 1596, "nimis vigiliis ac typographicis laboribus consumptus," as his tombstone in the churchyard of St Peter's in Heidelberg has it. There is a careful notice of his life by K. W. Justi in Strieder's *Hessische Gelehrten-Geschichte*, xviii 481 sq.

SYLHET, a British district of India, in the province of Assam, lying between 25° 12' and 23° 59' N lat and 91° and 92° 38' E long, with an area of 5381 square miles. It is bounded on the N by the Khāsi and Jaintia Hills district, on the E by Cachar, on the S by the state of Hill Tipperah and the district of Tipperah, and on the W by the district of Maimansingh. Sylhet consists of the lower valley of the Surma or Barak river, and for the most part is a uniform level, broken only by scattered clusters of sandy hillocks called *tildas*, and intersected by a network of rivers and drainage channels. In the south eight low ranges of hills, spurs of the Tipperah Mountains, run out into the plain, the highest range being about 1500 feet above sea-level. There is also a small detached group in the centre of the district called the Ita Hills. Entering the district from Cachar, the Surma bifurcates into two branches: the main branch flows beneath the hills bordering the north-east part, while the minor branch, the Kusiāra, flows in a south-westerly direction across the district, they again unite on the south-western boundary and fall into the Meghna under the name of Dhaleswari. Both branches are navigable by large boats and support a busy traffic. The wild animals of the district comprise elephants, tigers, buffaloes, bison, and several varieties of deer. The climate of Sylhet is extremely damp and the rainfall is heavy, reaching an annual average of over 150 inches, the rainy season generally lasts from April to October.

In 1881 the population was returned at 1,969,009, of whom 999,785 were males and 969,224 females. Hindus numbered 949,363, Mohammedans 1,015,531, and hill tribes 3708. The only places with a population exceeding 5000 are Sylhet town (14,407) and Kashba Banrachang, a large village (24,061). Sylhet town, the administrative headquarters of the district, is situated on the right or north bank of the Surma, and besides the usual public offices contains a handsome church and the mosque of Shah Jalal (a fakir whose miraculous powers contributed greatly to the Mussulman conquest of the country), which attracts pilgrims from great distances. Out of the total area 3080 square miles were returned as under cultivation in 1882-83 and 654 as cultivable. The staple crop is rice, which yields three harvests during the year. There are immense forest tracts in the south eastern parts of Sylhet. The chief industries are the weaving by Manipuri women of cotton cloths called *Manipuri llesh*, also handkerchiefs and mosquito curtains tastefully embroidered with silk. The manufacture of mats, ivory and shell carving, and other ornamental work are also pursued with much skill and elegance.

Sylhet with the rest of Bengal passed into the hands of the British in 1765. Previous to 1874 Sylhet formed an integral part of Bengal, being included in the Dacca division, but in September of that year it was annexed, together with the adjoining district of Cachar, to the chief commissionership of Assam.

SYLT (probably from the Old Frisian *Silenti*, i.e., "sea-land") is the largest German island in the North Sea, being 40 square miles in area and nearly 23 miles long. It is, however, very narrow, generally about half a mile in width, except in the middle, where it sends out a peninsula 7 miles across. It belongs to the province of Schleswig-Holstein, and lies from 7 to 12 miles from the Schleswig coast. Its long and slender outline is highly suggestive of its former position as part of a continuous line of coast, now in great part swept away. The invasion of the sea has made considerable progress even within a comparatively recent period, and several hamlets were swallowed up in the 13th and 14th centuries. The process of gradual waste is still going on, though it is now obviated to some extent by the exertions of the Prussian Government, and counterbalanced by deposits of mud on the landward side. The central peninsula contains some "marshland" and moorland pasture, on which a few thousand sheep are grazed, but the rest of the island consists merely of dunes or sand hills, which at places attain a height of from 100 to 150 feet. The inhabitants, about 3000 in number, are of Frisian origin, though a few in the extreme north of the island speak Danish. Their occupations are fishing, oyster dredging, seamanship, and wild-duck catching; the women make large quantities of woollen jackets. The chief places are Kertum (850 inhabitants), Westerland, which is annually visited by about 1500 sea-bathers, and Morsum. Some very interesting pagan tombs have been found on the island.

SYLVESTER. See **SILVESTER**.

SYMBOL. See **CREEDS**.

SYME, JAMES (1799-1870), surgeon, was born at Edinburgh on 7th November 1799. His father was a writer to the signet and a landowner in Fife and Kinross, who lost most of his fortune in attempting to develop the mineral resources of his property. James was sent to the High School at the age of nine, and remained there until he was fifteen, when he entered the university. For two years he frequented the arts classes (including botany), and in 1817 began the medical curriculum, devoting himself with particular keenness to chemistry. His chemical experiments led him to the discovery that "a valuable substance is obtainable from coal tar which has the property of dissolving india-rubber," and could be used for waterproofing silk and other textile fabrics,—an idea which was patented a few months afterwards by Macintosh of Glasgow. In the session of 1818-19 Syme became assistant and demonstrator in the dissecting room of Liston, who had started as an extra-mural teacher of anatomy in competition with his old master Barclay, in those

years he held also resident appointments in the infirmary and the fever hospital, and spent some time in Paris practising dissection and operative surgery. In 1823 Liston handed over to him the whole charge of his anatomy classes, retaining his interest in the school as a pecuniary venture, the arrangement did not work smoothly, and a feud with Liston arose, which did not terminate until twenty years later, when the latter was settled in London. Syme's next venture was the Brown Square school of medicine, which he started in 1824-25 in conjunction with Dr Macintosh, Dr Fletcher, and others, the partnership was again inharmonious, and soon came to an end. Announcing his intention to practise surgery only, Syme started a surgical hospital of his own, Minto House hospital, which he carried on from May 1829 to September 1833, with great success as a surgical charity and school of clinical instruction. It was here that he first put into practice his method of clinical teaching, which consisted in having the patients to be operated or prelected upon brought from the ward into a lecture-room or theatre where the students were seated conveniently for seeing and taking notes. His private practice had become very considerable, his position having been assured ever since his amputation at the hip joint in 1823, the first of the kind in Scotland. In 1833 he succeeded Russel as professor of clinical surgery in the university. Syme's accession to the clinical chair was marked by two important changes in the conditions of it: the first was that the professor should have the care of surgical patients in the infirmary in right of his professorship, and the second, that attendance on his course should be obligatory on all candidates for the medical degree. When Liston removed to London in 1835 Syme became the leading consulting surgeon in Scotland. On Liston's death in 1847 Syme was offered his vacant chair of clinical surgery at University College, London, and accepted it. He began practice in London in February 1848, but early in May the same year difficulties with two of his colleagues at Gower Street and a desire to "escape from animosity and contention" led him to throw up his appointment. He returned to Edinburgh in July, and was re-instated in his old chair, which the crown authority had meanwhile found a difficulty in appointing to. The judgment of his friends was that "he was always right in the matter, but often wrong in the manner, of his quarrels." In 1849 he broached the subject of medical reform in a letter to the lord advocate, in 1854 and 1857 he addressed open letters on the same subject to Lord Palmerston, and in 1858 a Medical Act was passed which largely followed the lines laid down by himself. As a member of the General Medical Council called into existence by the Act, he made considerable stir in 1868 by an uncompromising statement of doctrines on medical education, which were thought by many to be reactionary, they were, however, merely an attempt to recommend the methods that had been characteristic of Edinburgh teaching since Cullen's time,—namely, a constant reference of facts to principles, the subordination (but not the sacrifice) of technical details to generalities, and the preference of large professorial classes and the "magnetism of numbers" to the tutorial system, which he identified with "cramming." In April 1869 he had a paralytic seizure, and at once resigned his chair, he never recovered his powers, and died on 26th June 1870.

Syme's surgical writings are numerous, although the terseness of his style and directness of his method save them from being bulky. In 1831 he published *A Treatise on the Excision of Diseased Joints* (the celebrated ankle joint amputation is known by his name). His *Principles of Surgery* (often reprinted) came out a few months later, *Diseases of the Rectum* in 1838, *Stricture of the Urethra and Fistula in Perineo* in 1849, and *Excision of the Scapula* in 1864. In 1848 he collected into a volume, under the title of *Contributions*

to the Pathology and Practice of Surgery, thirty-one original memoirs, published in periodicals from time to time, and in 1861 he issued another volume of *Observations in Clinical Surgery*. Syme's character is not imaptly summed up in the dedication to him by his old pupil, Dr John Brown, of the series of essays *Locke and Sydenham*: "Verax, capax, perspicax, sagax, efficax, tonax."

See *Memorial of the Life of James Syme*, by R. Paterson, M.D., with portraits, Edinburgh, 1874.

SYMEON OF DURHAM was the author of two works of great importance in English history, especially in that of northern England, viz., the *Historia Dunelmensis Ecclesie* and the *Historia Regum*. Very little is known of his life. There is no record of the date of his birth or death. He was at Jarrow about 1080, before the monastic community moved thence to Durham (1083). He probably did not become a professed monk till some time after that event. In 1104 he was present at the opening of the coffin and the examination of the remains of St Cuthbert. Between 1104 and 1108 he composed his *History of the Church of Durham*, bringing it down to the death of William of St Carilef (1096). Many years later he compiled his *Historia Regum*, which is a chronicle of Northumbrian affairs from the date at which Bede stops (731). He was also probably the author of a letter *De Archiepiscopis Eboraci*, but not of the treatise *De Miraculis et Translationibus* sometimes attributed to him. Selden, in his introduction to Twyssen's *Decem Scriptores*, attributes the *Historia Dunelmensis Ecclesie* to Turgot, prior of that church, but Mr Arnold, in the preface to his edition of Symeon's works, successfully disproves Selden's assertions. This work is original and of great value, the *Historia Regum*, on the other hand, is a compilation from various sources, brought down by Symeon to 1121 or 1129. Both works were continued by other hands.

See Twyssen, *Decem Scriptores*, and prefaces to Symeon's works, by Mr Hodgson Hinde (Surtess Society edition, 1868) and by Mr T. Arnold (Rolls Series edition, 1882 &c).

SYMEON, surnamed METAPHRASES, Byzantine hagiographer, according to Leo Allatius (*De Symeonum Scriptis*, Paris, 1664), lived during the first half of the 10th century under Leo the Philosopher and his successor at Constantinople, where he successively held the positions of secretary, grand logothete, and master of the palace. This view, subsequently adopted by Cave, Fabricius, and others, was afterwards disputed, but not convincingly, by Oudin (*Comm. de Script. Eccles. Antiq.*, vol. II, 1722), who identified Metaphrastes with another Symeon who also held the offices of logothete and master of the palace under John Comnenus, and published a still extant *Epitome Canonum* in 1160. Symeon's *Metaphrases*, as his legends are called (whence his name Metaphrastes), occur in MS in many European libraries, many of them are also to be found in the *Acta Sanctorum* and similar collections, but others remain unprinted. Allatius and Cave recognize only 122 of the hundreds of lives assigned to him as genuine. The titles of other writings of Symeon, with references to further authorities, will be found in the article "Metaphrastes," by Gass, in Herzog-Phitt's *Encycl.*, vol. IV.

SYMMACHUS, pope from 498 to 514, had Anastasius II. for his predecessor and was himself followed by Hormisdas. He was a native of Sardina, apparently a convert from paganism, and was in deacon's orders at the time of his election. The choice was not unanimous, another candidate, Laurentius, having the support of a strong Byzantine party, and both competitors were consecrated by their friends, the one in the Lateran church and the other in that of St Mary, on 22d November 498. A decision was not long afterwards obtained in favour of Symmachus from Theodoric, to whom the dispute had been referred, but peace was not established until 505 or 506, when the Gothic king ordered the Laurentian party to surrender the churches of which they had taken possession.

An important incident in the protracted controversy was the decision of the "palmary synod" (see vol. XII, p. 492). The remainder of the pontificate of Symmachus was uneventful, history speaks of various churches in Rome as having been built or beautified by him.

SYMMACHUS, QUINTUS AURELIUS, consul in 391, and one of the most brilliant representatives in public life and in literature of the old pagan party at Rome, was educated in Gaul, and, having discharged the functions of prætor and quæstor, rose to higher offices, and in 373 was proconsul of Africa. His public dignities, which included that of pontiff, his great wealth and high character, added to his reputation for eloquence, marked him out as the champion of the pagan senate against the measures which the Christian emperors directed against the old state religion of Rome. In 382 he was banished from Rome by Gratian for his protest against the removal of the statue and altar of Victory from the senate-house, and in 384, when he was prefect of the city, he addressed to Valentinian a letter praying for the restoration of these symbols. This is the most interesting of his literary remains, and called forth two replies from St Ambrose, as well as a poetical refutation from Prudentius. After this Symmachus was involved in the rebellion of Maximus, but obtained his pardon from Theodosius, and appears to have continued in public life up to his death.

Of the writings of Symmachus we possess (1) ten books of *Epistles*, published after his death by his son. The model followed by the writer is Pliny the Younger, and from a reference in the *Saturnalia* of Macrobius (bk. I, § 7), in which Symmachus is introduced as one of the interlocutors, it appears that his contemporaries deemed him second to none of the ancients in the "rich and florid" style. The first edition of the *Epistles* by Bart. Cysius (s. l. et a.), but published under Pope Julius II. is very incomplete, and the collection was only gradually completed by subsequent editors. (2) Fragments of nine *Complimentary Orations* from a palimpsest, of which part is at Milan and part in the Vatican, were discovered by Mai, who published the Milan fragments in 1815, the Roman ones in his *Scriptorum Veterum Nova Collectio*, vol. I (1825), and the whole in 1846. The work was not well done, and many corrections are given in a new collation by O. Seeck (*Commentationes in Honorem Th. Mommsen*, Berlin, 1877, p. 595 sq.), which has been followed by an edition of the works of Symmachus in the *Monumenta Germanicæ Historica*, Berlin, 1883.

See MUSIC, vol. XVII, p. 95.

SYMPHONY. See MUSIC, vol. XVII, p. 95.

SYNAGOGUE (συναγωγή), literally "assemblage," is the term employed to denote either a congregation of Jews, i.e., a local circle accustomed to meet together for worship and religious instruction, or the building in which the congregation met. In the first sense the word is a translation of כְּנֶסֶת, *kneseth*, in the second of בֵּית הַכְּנֶסֶת, *bêth ha-kneseth*. The germ of the synagogue, that is, of religious assemblages dissociated from the ancient ritual of the altar, may be found in the circle of the prophets and their disciples (see especially Isa. viii 16 sq.), but the synagogue as an institution characteristic of Judaism arose after the work of Ezra, and is closely connected with the development of that legal Judaism to which his reformation gave definite shape. From the time of Ezra downwards it was the business of every Jew to know the law, the school (*bêth hamidrâsh*) trained scholars, but the synagogue, where the law was read every Sabbath (Acts xv 21), was the means of popular instruction. Such synagogues existed in all parts of Judæa in the time of Psalm lxxiv 8 (probably a psalm of the Persian period), in Acts xv 21 it appears that they had existed for many generations "in every city." This held good not only for Palestine but for the Dispersion, in post-Talmudic times the rule was that a synagogue must be built wherever there were ten Jews. And, though the name "synagogue" varies with συναγωγή ("place of prayer"), it appears that everywhere the assemblage was primarily one for instruction in the law. The synagogue, as Philo puts it, was a διδασκαλεῖον. A formed institution

he was able to enjoy the literary leisure that was most congenial to him, varying his studies with gardening and hunting and the quiet pleasures of domestic life. His marriage took place at Alexandria in 403, in the previous year he had visited Athens. In 409 or 410 Synesius, whose Christianity had until then been by no means very pronounced, was popularly chosen to be bishop of Ptolemais, and, after long hesitation on personal and doctrinal grounds, he ultimately accepted the office thus thrust upon him, being consecrated by Theophilus at Alexandria. One personal difficulty at least was obviated by his being allowed to retain his wife, to whom he was much attached, but as regarded orthodoxy he expressly stipulated for personal freedom to dissent on the questions of the soul's creation, a literal resurrection, and the final destruction of the world, while at the same time he agreed to make some concession to popular views in his public teaching (*τὰ μὲν οἰκοὶ φιλοσοφῶν, τὰ δ' ἕξω φιλομυθεῖν*). His tenure of the bishopric, which was comparatively brief, was troubled not only by domestic bereavements but also by barbaric invasions of the country, and by conflicts with the prefect Andronius, whom he excommunicated for interfering with the church's right of asylum. The date of his death is unknown, but he died probably not later than 414.

His extant works are—(1) a speech before Arcadius, *De Regno*, (2) *Dio, sive de suo ipsius Instituto*, in which he signifies his purpose to devote himself to true philosophy, (3) *Encomium Calvitii*, a literary *jeu d'esprit*, suggested by Dio Chrysostom's *Praise of Hair*, (4) *De Providentia*, in two books, (5) *De Insomniis*, (6) 157 *Epistola*, (7) 12 *Hymni*, and several homilies and occasional speeches. The *editio princeps* is that of Turnebus (Paris, 1553), it was followed by that of Morrell, with Latin translation by Petavius (1612, greatly enlarged and improved 1633, reprinted by Migne, 1859). The *Epistola*, which for the modern reader greatly exceed his other works in interest, have been edited by Demetriades (Vienna, 1792) and by Glukus (Venice, 1812), the *Calvitii Encomium* by Krabinger (Stuttgart, 1834), the *De Providentia* by Krabinger (Sulzbach, 1835), the *De Regno* by Krabinger (Munich, 1825), and the *Hymni* by Flach (Tübingen, 1875).

See Clausen, *De Synesio Philosopho* (Copenhagen, 1831). Volkmann, *Synesius von Cyrene* (Berlin, 1869), and Miss Alice Gardner's monograph in "The Fathers for English Readers" (London, 1890).

SYNOD See COUNCIL and PRESBYTERIANISM

SYPHILIS See PATHOLOGY, vol xviii pp 404, 405, and SURGERY, p 686 above

SYRA, or **SYROS**, a Greek island in the middle of the Cyclades, which in the 19th century has become the commercial centre of the Archipelago, and is also the residence of the nomarch of the Cyclades and the seat of the central law courts. In ancient times this island was remarkably fertile, as is to be gathered not only from the Homeric description (*Od* xv 403), which might be of doubtful application, but also from the remains of olive presses and peculiarities in the local nomenclature. The destruction of its forests has led to the loss of all its alluvial soil, and now it is for the most part a brown and barren rock, covered at best with scanty aromatic scrub, pastured by sheep and goats. The length of the island is about 10 miles, the breadth 5, and the area is estimated at 42½ square miles. The population is now estimated to number about 33,700, of whom about 20,500 are in the chief town. Commerce is the main occupation of the islanders, though they also build ships, have extensive tanneries, large steam flour-mills, a steam weaving and rope factory, and a handkerchief factory, and grow vegetables for export.

Hermopolis, as the chief town is called, is built round the harbour on the east side of the island. It is governed by an active municipality, whose revenue and expenditure have rapidly increased. Among the public buildings are a spacious town hall in the central square, a club house, an opera house, and a Greek theatre. Old Syra, on a conical hill behind the port town, is an interesting place, with its old Roman Catholic church of St George's still crowning the summit. This was built by the Capelinus, who in the Middle Ages chose Syra as the headquarters of a mission in the East. Louis XIII, hearing of the dangers to which the Syra priests were exposed, took the island under his special protection, and since that

time the Roman Catholic bishops of Syra have been elected by the pope. About the beginning of the 19th century the inhabitants of Syra numbered only about 1000, whenever a Turkish vessel appeared they made off to the interior and hid themselves. On the outbreak of the war of Greek independence refugees from Chios, after being scattered throughout Tinos, Spezia, Hydra, &c., and rejected by the people of Ceos, took up their residence at Syra under the protection of the French flag. Altogether about 40,000 had sought this asylum before the freedom of Greece was achieved. The chief city was called Hermopolis after the name of the ship which brought the earlier settlers. Most of the immigrants elected to stay, and, though they were long kept in alarm by pirates, they have continued steadily to prosper. In 1875 1568 sailing ships and 698 steamers (with a total of 740,731 tons) entered and 1588 sailing ships and 700 steamers (with a total of 756,807 tons) cleared this port, in 1883 3379 sailing and 1126 steam vessels (with a total of 1,056,201 tons) entered and 3276 sailing and 1120 steam vessels (with a total of 960,229 tons) cleared. Most of the sailing vessels were Greek and Turkish, and most of the steamers were Austrian, French, and Turkish.

SYRACUSE (*Συράκοσαι, Συράκουσαι, Συρήκουσαι*, Lat *T. Syracusæ*, It *Siracusa*), the chief Greek city of ancient Sicily and one of the earliest Greek settlements in the island (see SICILY, p 15 above). The foundation legend takes several shapes (Thuc, vi 3, Strabo, vi 4, p 269), but there is no reason to doubt that Syracuse was founded by Archias of Corinth as part of a joint enterprise together with Coreyra, and the received date 735 B.C. may pass as approximate.¹ The first settlement was on a small island, parted from the coast by a very narrow channel (for map, see pl II). It points southward, in front of a deep bay, which, with the opposite headland (Plemmyrium), it helps to shelter from the sea. This formed the Great Harbour, the Lesser Harbour of Lacæus lay to the north of the island, between it and a peninsula of the mainland, with the open sea to the east and north. The peninsula consists of part of a hill which almost everywhere leaves some space between itself and the sea. To the west of the Great Harbour a marshy plain lies on each side of the river Anapus. On the south side of the river is a smaller hill. The coast of the island and of the peninsula is rocky. That of the harbour is for the most part flat, except part of the west and south sides and the headland opposite the island. From the island the city spread over the whole peninsula, while a detached suburb (Polichne) arose on the outlying hill beyond Anapus. The marshy ground between the two was not fit for building. All these additions have been gradually forsaken, and the modern town is confined to the island.

The island was called Ortygia, a name connected with the Delian legend of Artemis (see Holm, *Gesch Sic*, i Ortyg 886), but often simply the Island (Liv, xxv 24, 30). Though the lowest part of the city, its position and strength made it the citadel, and it is therefore often spoken of by Diodorus and Plutarch as if it had been a real acropolis. It is famous for the fountain of Arethusa, connected in Greek legend with the river Alpheus in Peloponnesus.² The sweet water perished when an earthquake brought in the sea in 1170.³ At the time of the first settlement the island was held by Sicels, some have thought that a Phœnician element lingered on under both Sicels and Greeks. It is certain (Herod, vi 166) that Syracuse and Carthage stood in relations to one another which were not usual between Greek and barbarian cities. It has also been thought from some legendary hints that Polichne was the original Syracuse, and that the plural form (*Συράκουσαι*) arose from the union of Ortygia and Polichne. But the plural form is common enough in other cases. The chief evidence for the belief is that the

415 The Syracusans were neither at unity among themselves nor by any means adequately prepared for effectual defence. Through out the whole struggle it is perfectly clear that they owed their great deliverance to the most extraordinary good fortune. Athens had the prize within her grasp, and she lost it wholly through the persistent dilatoriness and blundering of her general, the desponding, vacillating Nicias. It was at his advice that the summer and autumn of 415 were frittered away and the siege not begun till the spring of 414. By that time the Syracusans were both in better spirits and better prepared: their troops were better organized, and they had built a wall from the Great Harbour to Panagia so as to screen them from attack on the side of Epipolæ on the north-west. The effect of this was to bar the enemy's approach and push back his blockading lines, which had to be carried over an inconveniently large extent of ground. The Syracusans had been at first thoroughly cowed, but they were cowed no longer, and they once plucked up courage to sally out and fight the enemy on the high ground of Epipolæ. They were beaten and driven back, but at the suggestion of Hermocrates they carried a counter work up the slope of Epipolæ, which, if completed, would cut in two the Athenian lines and frustrate the blockade. At this point Nicias showed considerable military skill. The Syracusans' work was destroyed by a prompt and well executed attack, and a second counter work carried across marshy ground some distance to the south of Epipolæ and near to the Great Harbour was also demolished after a sharp action, in which Lamachus fell. However, the blockade on the land side was now almost complete, and the Athenian fleet had at the same time entered the Great Harbour. The citizens began to think of surrender, and Nicias was so confident that he neglected to push his advantages. He left a gap in his lines at the point where Epipolæ slopes down to the sea, and he omitted to occupy an important position on its north-western ridge, known as Eurymus, a pass which commanded on this side the approach to the city from the interior.

The second act of the drama may be said to open with the irretrievable blunder of Nicias in letting the Spartan Gylippus first land in Sicily, and then march at the head of a small army, partly levied on the spot, across the island, and enter Syracuse by way of Epipolæ, through the Eurymus pass. Gylippus was felt to be the representative of Sparta, and of the Peloponnesian Greeks generally, and his arrival inspired the Syracusans with the fullest confidence. Just before his arrival a few ships from Corinth had made their way into the harbour with the news that a great fleet was already on its way to the relief of the city. The tables were now completely turned, and we hear of nothing but defeat and disaster for the besiegers till their final overthrow. The military skill of Gylippus enabled the Syracusan militia to meet the Athenian troops on equal terms, to wrest from them their fortified position on Plemyrium, and to reduce them to such a plight that, as Nicias said in his despatch to Athens towards the close of 414, they were themselves besieged rather than besieging. In the spring of the following year Syracuse once again gave herself up for lost, when seventy-three warships from Athens, under Demosthenes, entered the harbour with a large force of heavy infantry and light troops. Demosthenes decided at once to make a grand attack on Epipolæ, with a view to recovering the Athenian blockading lines and driving the Syracusans back within the city walls. The assault was made by night, by the uncertain light of the moon, and this circumstance turned what was very nearly a successful surprise into a ruinous defeat. The affair seems to have been well planned up to a certain point, and well executed, but the Athenian van, flushed with a first success, their ranks broken and disordered by a pursuit of the enemy over rough ground, were repulsed with great loss by a body of heavy armed Boeotians, and driven back in disorder. The confusion spread to the troops behind them, and the action ended in a wild flight through the narrow roads and passes of Epipolæ. The army was now thoroughly out of heart, and Demosthenes was for at once breaking up the camp, embarking the troops, and sailing back to Athens. But Nicias could not bring himself to face the Athenian people at home, nor could he be prevailed on to retire promptly to some position on the coast, such as Catania or Thapsus, where the army would be at least able to maintain itself for a time. He dithered till the end of August, many weeks after the defeat, and on the 27th of that month was an eclipse of the moon, on the strength of which he insisted on a delay of almost another month. His fleet too lingered uselessly in the harbour, till, after a frantic effort to break out and a desperate conflict, it was utterly defeated and half destroyed. The broken and demoralized army, its ranks thinned by fever and sickness, at last began its hopeless retreat in the face of the numerous Syracusan cavalry, and, after a few days of dreadful suffering, was forced to lay down its arms. The Syracusans sullied the glory of their triumph by huddling their prisoners into their stone quarries,—a living death, dragged out, for some of them at least, to the space of seventy days.

Her great deliverance and victory naturally stirred up

the energies of Syracuse at home and abroad. Syracusan ships under Hermocrates now play a not unimportant part in the warfare between Sparta and Athens on the coast of Asia. Under the influence of Diocles the constitution became a still more confirmed democracy, some at least of the magistracies being filled by lot, as at Athens (Diod., xiii, 31, 35, Arist., *Pol.*, v 36). Diocles appears also as the author of a code of laws of great strictness, which was held in such esteem that later lawgivers were deemed only its expounders. There seems no reason to suppose, with Holm, an earlier lawgiver Diocles distinct from the demagogue, but the story of his death by his own hand to punish a breach of his own law is, we may suspect, a repetition of the story of Charondas (Diod., xiii 33, cf. xii 19). Under these influences Hermocrates was banished in 409, he submitted to the sentence, notwithstanding the wishes of his army. He went back to Sicily, warred with Carthage on his own account, and brought back the bones of the unburied Syracusans from Himera, but was still so dreaded that the people banished Diocles without restoring him. In 407 he was slain in an attempt to enter the city, and with him was wounded one who was presently to outstrip both rivals.

This was Dionysius, son of another Hermocrates, and an adherent of the aristocratic party, but soon afterwards a demagogue, though supported by some men of rank, among them the historian Philistus (Diod., xiii 91, 92). By accusing the generals engaged at Gela in the war against Carthage, by obtaining the restoration of exiles, by a variety of tricks played at Gela itself, he secured his own election, first as one of the generals, then as sole general (or with a nominal colleague) with special powers. He next, by another trick, procured from a military assembly at Leontini a vote of a bodyguard, he hired mercenaries and in 406-5 came back to Syracuse as tyrant of the city (Diod., xiii 91-96). Dionysius kept his power till his death thirty-eight years later (367). But it was wellnigh overthrown before he had fully grasped it. His defeat before Gela (see SICILY, p. 18) was of course turned against him. His enemies in the army, chiefly the horsemen, reached Syracuse before him, plundered his house—he had not yet a fortress—and horribly maltreated his wife, but they took no political or military steps against himself. He came and took his vengeance, slaying and driving out his enemies, who established themselves at Ætna (Diod., xiii 113). This revolution and the peace with the Carthaginians confirmed Dionysius in the possession of Syracuse, but of no great territory beyond, as Leontini was again a separate city. It left Syracuse the one great Hellenic city of Sicily, which, however enslaved at home, was at least independent of the barbarian. Dionysius was able, like Gelon, though with less success and less honour, to take up the part of the champion of Hellas.

During the long tyranny of Dionysius the city grew greatly in size, population, and grandeur. Plato says (*Epist.*, vii) that he of the gathered all Sicily into it. In fact the free Greek cities and communities, in both Sicily and southern Italy, were sacrificed to Syracuse, where the greatness and glory of the Greek world in the West were concentrated. The mass of the population of Gela and Camarina in the disastrous year 405 had, at the prompting of Dionysius, taken refuge at Syracuse. Gela had in the previous year received the fugitive inhabitants of Agrigento, which had been sacked by the Carthaginians. Syracuse thus absorbed three of the chief Greek cities of Sicily. It received large accessions from some of the Greek cities of southern Italy, from Hipponium on its west and Canolma on its east coast, both of which Dionysius captured in 389 B.C. There had also been an influx of free citizens from Rhegium. At the time of the Athenian siege Syracuse consisted of two quarters—the Island and the "outer city" of Thueydides, generally known as Achradina, and bounded by the sea on the north and east, with the adjoining suburb of Apollo Temenites farther inland at the foot of the southern slopes of Epipolæ. With the vast increase in its population, it now grew

into a city of four quarters. The suburb Temenites was expanded into Neapolis (New Town), spreading over the adjoining slopes. A district stretching down to the sea, to the north west of Achradina, was taken in, and subsequently enlarged into a separate fortified town. Tyche (Tyxh) was the name given to this quarter, according to Cicero (*In Verr.*, iv 52, 53) from an old temple of Fortune somewhere within its limits,—a fact which seems to indicate that the spot must have been inhabited in very early times. But of this Thucydides says nothing, and his silence on a point which would have naturally entered into his description of the Athenian blockading operations is somewhat perplexing. This quarter was in Cicero's time the most populous part of the entire city, it was practically secured by the new city walls, which were drawn inland in a triangular form so as to enclose the hill of Epipolæ, the apex of the triangle being the fortress of Euryalus, the remains of which are said to be the most perfect existing specimen of ancient fortification. Syracuse was now secure on the land side. The Island (Ortygia) had been provided with its own defences, converted in fact into a separate stronghold, with a fort to serve specially as a magazine of corn, and with a citadel or acropolis which stood apart, and might be held as a last refuge. Dionysius, to make himself perfectly safe, drove out a number of the old inhabitants and turned the place into barracks for his soldiers, he himself living in the citadel. For any unpopularity he may have thus incurred he seems to have made up by his great works for the defence of the city, these were executed under the direction of the most skilful engineers, and are said to have found employment for 60,000 men. The new lines covered an extent of $3\frac{1}{2}$ miles, and were constructed of huge well cut blocks of stone from the neighbouring quarries. Each quarter of the city had its own distinct defences, and Syracuse was now the most splendid and the best fortified of all Greek cities. Its naval power, too, was vastly increased, the docks were enlarged, and 200 new warships were built. Besides the triremes, or vessels with three banks of oars, we hear of quadriremes and quinqueremes with four and five banks of oars,—larger and taller and more massive ships than had yet been used in Greek sea warfare. The fleet of Dionysius was the most powerful in the Mediterranean. It was doubtless fear and hatred of Carthage, from which city the Greeks of Sicily had suffered so much, that urged the Syracusans to acquiesce in the enormous expenditure which they must have incurred under the rule of Dionysius. Much too was done for the beauty of the city as well as for its strength and defence. Several new temples were built, and gymnasia erected outside the walls near the banks of the Anapus (Diod., xv 13).

Dionysius the Younger. "Fastened by chains of adamant" was the boastful phrase in which Dionysius described his empire, but under his son, the younger Dionysius, an easy, good-natured, unpractical man, a sort of cleverish dilettante, a reaction set in amongst the restless citizens of Syracuse, which, with its vast and mixed population, must have been full of elements of turbulence and faction. But the burdensome expenditure of the late reign would be enough to account for a good deal of discontent. A remarkable man now comes to the front,—Dion, the friend and disciple of Plato, and for a time the trusted political adviser of Dionysius, whom he endeavoured to impress with a conviction of the infinite superiority of free and popular government to any form of tyranny or despotism. Dion's idea seems to have been to make Dionysius something like a constitutional sovereign, and with this view he brought him into contact with Plato. All went well for a time, but Dionysius had those about him who were opposed to any kind of liberal reform, and the result was the banishment of Dion from Syracuse as a dangerous innovator. Ten years afterwards, in 357, the exile entered Achradina a victor, welcomed by the citizens as a deliverer both of themselves and of the Greeks of Sicily generally. As yet, however, this was the only part of the city gained. A siege and blockade, with confused fighting and alternate victory and defeat, and all the horrors of fire and slaughter, followed, till Dion made himself master of the mainland city. Ortygia, however, was still held by Dionysius, but, provisions failing, it also was soon surrendered. Dion's rule lasted only three years, for he perished in 354 by the hand of a Syracusan assassin. It was, in fact, after all his professions, little better than a military despotism. The tyrant's stronghold in the Island was left standing,

and Dion actually opposed a proposal for its destruction. The man who won immense popularity by the proposal was murdered, and Dion seems to have been an accomplice in the crime.

Of what took place in Syracuse during the next ten years we know but little. The younger Dionysius came back and from his island fortress again oppressed the citizens, the plight of the city, torn by faction and conflicts and plundered by foreign troops, was so utterly wretched that all Greek life seemed on the verge of extinction (Plato, *Epist.*, viii.) Sicily, too, was again menaced by Carthage. Syracuse, in its extremity, asked help from the mother-city, Corinth, and now appears on the scene one of the noblest figures in Greek history, TIMOLEON (qv). To him Syracuse owed her deliverance from the younger Dionysius and from the rule of despots, Leon, and to him both Syracuse and the Sicilian Greeks owed a decisive triumph over Carthage and the safe possession of Sicily west of the river Halycus, the largest portion of the island. From 343 to 337 he was supreme at Syracuse, with the hearty goodwill of the citizens. The younger Dionysius had been allowed to retire to Corinth, his island fortress was destroyed and replaced by a court of justice. Syracuse rose again out of her desolation—grass, it is said, grew in her streets—and, with an influx of a multitude of new colonists from Greece and from towns of Sicily and Italy, once more became a prosperous city. Timoleon, having accomplished his work, accepted the position of a private citizen, though, practically, to the end of his life he was the ruler of the Syracusan people. After his death (337) a splendid monument, with porticoes and gymnasia surrounding it, known as the Timoleonium, was raised at the public cost to his honour.

In the interval of twenty years between the death of Agathocles, Timoleon and the rise of Agathocles to power another revolution at Syracuse transferred the government to an oligarchy of 600 leading citizens. All we know is the bare fact. It was shortly after this revolution, in 317, that Agathocles with a body of mercenaries from Campania and a host of exiles from the Greek cities, backed up by the Carthaginian Hamilcar, who was in friendly relations with the Syracusan oligarchy, became tyrant or despot of the city, assuming subsequently, on the strength of his successes against Carthage, the title of king. Syracuse passed through another reign of terror, the new despot proclaimed himself the champion of popular government, and had the senate and the heads of the oligarchical party massacred wholesale. This man of blood seems to have had popular manners, and to have known how to flatter and cajole, for a unanimous vote of the people gave him absolute control over the fortunes of Syracuse. His wars in Sicily and Africa left him time to do something for the relief of the poorer citizens at the expense of the rich, as well as to erect new fortifications and public buildings, and under his strong government Syracuse seems to have been at least quiet and orderly. After his death in 289 comes another miserable and obscure period of revolution and despotism, in which Greek life was dying out, and but for the brief intervention of Pyrrhus in 278 Syracuse, and indeed all Sicily, would have fallen a prey to the Carthaginians.

A better time began under Hiero II., who had fought Hiero II under Pyrrhus and who rose from the rank of general of the Syracusan army to be tyrant—king, as he came to be soon styled—about 270. During his reign of over fifty years, ending probably in 216, Syracuse enjoyed tranquillity, and seems to have grown greatly in wealth and population. Hiero's rule was kindly and enlightened, combining good order with a fair share of liberty and self-government. His financial legislation was careful and con-

siderate, his laws¹ as to the customs and the corn titles were accepted and maintained under the Roman government, and one of the many bad acts of the notorious Verres, according to Cicero, was to set them aside (Cic. *In Ver.*, ii 13, iii 8). It was a time too for great public works,—works for defence at the entrance of the Lesser Harbour between the Island and Achradina, and temples and gymnasia. Hiero through his long reign was the staunch friend and ally of Rome in her struggles with Carthage, but his paternal despotism, under which Greek life and civilization at Syracuse had greatly flourished, was unfortunately succeeded by the rule of a man who wholly reversed his policy.

Hieronymus

Hieronymus, the grandson of Hiero, thought fit to ally himself with Carthage, he did not live, however, to see the mischief he had done, for he fell in a conspiracy which he had wantonly provoked by his arrogance and cruelty. There was a fierce popular outbreak and more bloodshed: the conspirators were put to death and Hiero's family was murdered, whilst the Carthaginian faction, under the pretence of delivering the city from its tyrants, got the upper hand and drew the citizens into open defiance of Rome. Marcellus was then in command of the Roman army in Sicily, and he threatened the Syracusans with attack unless they would get rid of Epicydes and Hippocrates, the heads of the anti-Roman faction. Epicydes did his best to stir up the citizens of Leontium against Rome and the Roman party at Syracuse. Marcellus therefore struck his first blow at Leontium, which was quickly stormed, and the tale of the horrors of the sack was at once carried to Syracuse and roused the anger of its population, who could not but sympathize with their near neighbours, Greeks like themselves. The general feeling was now against any negotiations with the Roman general, and, putting themselves under Epicydes and Hippocrates, they closed their gates on him. Marcellus, after an unsuccessful attempt to negotiate, began the siege in regular form (214 B.C.) by both land and sea, establishing a camp on Pachynne, where stood the old temple of Olympian Zeus, but he made his chief assault on the northern side and on the defences of Tyche, particularly at the Hecapylum, the entrance facing Megara and Leontium. His assault seawards was made mainly on Achradina, but the city was defended by a numerous soldiery and by what seem to have been still more formidable, the ingenious contrivances of Archimedes, whose engines dealt havoc among the Roman ships, and frustrated the attack on the fortifications on the northern slopes of Epipolæ (Liv., lvi 34). Marcellus had recourse to a blockade, but Carthaginian vessels from time to time contrived to throw in supplies. At length treachery began to work within. Information was given him in the spring of 212 (two years from the commencement of the siege) that the Syracusans were celebrating a great festival to Artemis, making use of this opportunity, he forced the Hecapylum entrance by night and established himself in Tyche and on the heights of Epipolæ. The strong fortress of Euryalus held out for a time, but, being now isolated, it soon had to surrender. The "outer" and the "inner city" of Thucydides still held out, whilst a Carthaginian fleet was moored off Achradina and Carthaginian troops were encamped on the spot. But a pestilence broke out in the autumn of 212, which swept them clean away, and thinned the Roman ranks. The ships sailed away to Carthage, on their way back to Syracuse with supplies they could not get beyond Cape Pachynus owing to adverse winds, and they were confronted by a Roman fleet. All hope for the city being now at an end, the Syracusans threw themselves on the mercy of Mar-

Sicily by
Marcellus

cellus, but Achradina and the Island still held out for a brief space under the Syracusan mercenaries, till one of their officers, a Spaniard, betrayed the latter position to the enemy, and at the same time Achradina was carried and taken. Marcellus gave the city up to plunder (Liv., lvi 31), and the art treasures² in which it was so rich—many of the choicest of them no doubt—were conveyed to Rome. From this time art seems to have become quite fashionable in certain Roman circles. Archimedes perished in the confusion of the sack, while he was calmly pursuing his studies (Liv., lvi 31).

Syracuse was now simply one of the provincial cities of Und Rome's empire, and its history is henceforward merged in that of Sicily. It retained much of its Greek character and many of its finest public buildings, even after the havoc wrought by Marcellus. Its importance and historic associations naturally marked it out as the residence of the Roman pretor or governor of Sicily. Cicero often speaks of it as a particularly splendid and beautiful city, as still in his own day the seat of art and culture³ (*Tusc.*, v 66, *De Deor. Nat.*, iii 81, *De Rep.*, i 21), and in his speeches against Verres (iv 52, 53) he gives an elaborate description of its four quarters (Achradina, Neapolis, Tycho, the Island), or rather the four cities which composed it. It seems to have suffered in the civil wars at the hands of Sextus Pompeius, the son of the triumvir, who for a short time was master of Sicily, to repair the mischief, new settlers were sent by Augustus in 21 B.C., and established in the Island and in the immediately adjoining part of Achradina (Strabo, vi. 270, ed. Kramer). It is in these districts that the remains of Roman works—of amphitheatres and other public buildings—are mainly to be traced. We hear nothing of any importance about Syracuse during the period of the empire. It had its own senate and its own magistrates⁴. Caius Caligula restored its decayed walls and some of its famous temples (Suetonius, *Calig.*, 21). Tacitus, in a passing mention of it (*Ann.*, xii 49), says that permission was granted to the Syracusans under Nero to exceed the prescribed number of gladiators in their shows. Hence the city by that time must have been provided with an amphitheatre. In the 4th century it is named by the poet Ausonius in his *Ordo Nobilium Urbium*, chiefly, perhaps, on the strength of its historic memories.

Modern Syracuse is confined to the island of Ortigia, and is only Modern about 2½ miles in circumference. The island is irregularly oval town. in shape, and extends from north to south on the east side of the fine natural harbour, the Porto Grande (*Magnus Portus*). On the north it is connected with the mainland by a dyke or narrow isthmus, and between the southern extremity and the opposite peninsula of Massolizza, the ancient Pleminyrum, there is a stretch of 1300 yards, forming the entrance to the harbour. The approach to the town from the mainland is defended by a dilapidated citadel of the time of Charles V., and the southern extremity is occupied by a castle named after George Maniace, the last Byzantine general by whom it was held in the 11th century before it fell into the hands of the Saracens. The town is further defended by walls with bastions. The streets are in general narrow, and their chief feature consists in their numerous convents with wooden-latticed windows. One tolerably wide and handsome street crosses the island from east to west. Besides the fortifications, the principal objects of interest are the cathedral of Santa Maria dello Colonne (the ancient temple of Minerva), adjoining which is the archiepiscopal residence, the archaeological museum, the finest works preserved in which are a statue of Venus in Parian marble and a colossal head of Zeus, and the fountain of Arethusa, which still bubbles up as clear and abundant as ever on the west side of the island. Its waters, however, are no longer drinkable, an earthquake in 1170 having allowed the sea water to become mingled with them. From the neighbourhood of this fountain a favourite promenade extends northwards along the shore of the Porto Grande. Syracuse has been a place of little importance since the year 878, when it was destroyed by the Saracens under Ibrahim ibn Ahmad.

² Statues and pictures are particularized by Livy, xvi 40.

³ The poets Theocritus and Moschus were Syracusans.

⁴ Local self government, in fact, like most of the Greek cities.

¹ The laws of Hiero are often mentioned with approval in Cicero's speeches against Verres.

Since that date the mainland portion of the city has never been rebuilt. Syracuse is the seat of an archbishop, and since 1865 it has been the capital of a province, which takes its name from the town. The inhabitants manufacture drugs and other chemical articles, earthenware, &c., and carry on a considerable trade, principally in wine. In 1885 785 vessels of 21,818 tons entered the port and 778 vessels of 21,480 tons cleared. At Syracuse Admiral de Ruyter died in 1676 after his defeat by the French at Agosta. The population in 1881 was 21,157.

See Hare, *Cities of Southern Italy and Sicily* (London, 1883).

SYRACUSE, a city of the United States, the county seat of Onondaga county, New York, 148 miles west of Albany, midway between that city and Buffalo. Syracuse is situated near the southern end of Onondaga Lake (5 miles long by 1 broad), whose water flows northwards through Seneca and Oswego rivers into Lake Ontario at Oswego. The Erie Canal, flowing east and west, joins the Oswego Canal within the city. Syracuse contains several handsome public buildings,—the county courthouse, the United States Government building, the city hall, the State asylum for idiots, the Onondaga penitentiary, the county orphan asylum, the asylum of St Vincent de Paul, the high school (containing the central library of 15,000 volumes), a State armoury, &c. Syracuse is the seat of a (Methodist) university, founded in 1870 and consisting of a college of the liberal arts, a college of the fine arts, and a college of physicians and surgeons. The salt industry, to which Syracuse owed much of its early prosperity, is still the staple, the springs situated near the southern end of Lake Onondaga, which appears to be the remains of a once very extensive basin, have been under State control since 1797. Previous to the opening of the Michigan springs they were the largest in the United States, and they still yield on an average from 7,000,000 to 8,000,000 bushels of salt per annum. Rolling mills, furnaces, steel-works, glass-works, breweries, and manufactories of barrels, agricultural machinery, and clothing are among the secondary industrial establishments. At the completion of the Erie Canal in 1825 Syracuse had only 300 inhabitants, by 1855 they were 25,107, and in 1860, 1870, and 1880 respectively they numbered 28,119, 43,051, and 51,792, in 1886 the number had risen to 81,000, including some adjacent villages recently annexed.

By some investigators it is believed that Lake Onondaga was Dr Soto's "silver bottomed" lake. The great tribal fortress of the Onondagas on the east side of the lake near the spot now occupied by Liverpool was attacked without success by Champlain in 1615. The first house on the site of Syracuse was built in 1805. The village, to which the name of Syracuse had been given in 1824, was incorporated in 1825, and the city in 1847.

SYR-DARIA (Gr and Lat *Jaxartes*, Arab *Shash* or *Sihun*), a river flowing into the Sea of Aral, and having a length of 1500 miles and a drainage area of about 320,000 square miles. Incertitude as to its source prevailed until the recent occupation of Turkestan by the Russians. It has now been traced to the Naryn, which has its sources in the heart of the Tian Shan complex, some 30 miles south of Lake Issik-kul, in the elevated valleys or *syts* (12,000 feet) on the southern slope of the Terskei Ala tau. Here under the name of Jaak-tash the river takes its rise amid mountain scenery of the wildest description, partly from the marshy mountain plateaus by which the "Warm Lake" is also fed, and partly from the immense glaciers of the dark and barren Ak-shunjak Mountains (Petroff and Sir-tash glaciers). After its union with another mountain stream, the Barskaun, it is called the Taragai, and flows west south west at from 11,000 to 10,000 feet above the sea, in a barren longitudinal valley between the Terskei Ala tau and the foothills of the lofty Kok-shat-tau. On entering a wild narrow gorge driven from west to east through the south-west continuation of the Terskei Mountains (Samatyn tau) it receives the name of Naryn. Through this gorge it descends by a series of rapids from

the heights of the mountain mass to a deep valley of the alpine region, its level at its issue from the gorge being reduced by fully 1000 feet. Fort Narynsk, 20 miles below the junction of the Great and the Little Naryn, is only

Map of Syr Darya.

6800 feet above the sea. Here the river enters a broad valley—formerly the bottom of an alpine lake—and flows past the ruins of Fort Kurika for 90 miles westward, as a stream some 50 yards wide and from 1 to 11 feet deep. Its waters are utilized for irrigating Kirghiz corn-fields, which contrast strangely with the barren aspect of the lofty treeless mountains. The Atira-sha—a large mountain stream—joins the Naryn at the head of this valley and the Atibuga at its lower end both from the left. Before reaching the lowlands, the Naryn crosses three ridges separating the valley of Kurika from that of Terghana, by a series of wild gorges and broad valleys (170 miles), representing the bottoms of old lakes, the Togus-torgan, 2000 feet lower than Kurika, and the Ketmen-tube are both covered with Kirghiz corn fields. Taking a wide sweep towards the north, the river enters Terghana—also the bottom of an immense lake—where, after joining the Kara Darya (Black river) in a Namangan, it receives the name of Syr Darya. The Kara-Darya is a mighty stream rising in the north-eastern spur of the Altai Mountains. As it deflects the Naryn towards the west again, the natives consider it the chief branch of the Syr Darya, but its volume is much smaller. At the confluence the Syr is 1440 feet above sea level.

The waters of the Syr Darya and its tributaries are in this part of its course largely absorbed by numberless canals for irrigation. It is to the Syr that Terghana is indebted for its high, if somewhat exaggerated, repute in Central Asia as a rich garden and primary cities like Khokand, Marghilan, and Namangan, and more than 800,000 inhabitants of the former Khanate of Khokand, live by its waters. Notwithstanding this drain upon it, the Syr could be easily navigated, were it not for the Bigovat rapids at Irtyar, at the lower end of the valley, where the river finds its way to the Aral-Caspian deserts by piercing a depression of the Mogol tau.

On issuing from this gorge the Syr enters the Aral depression, and flows for 850 miles in a north westerly and northerly direction before reaching the Sea of Aral. On this section it is navigated by steamers. Between the Irtyar rapids and Baidyr-turgai (where it bends north) the Syr flows along the base of the mountain ridges which girdle the Teshkat Mountains (see below) on the north west, and receives from the longitudinal valleys of these alpine tracts a series of tributaries (the Angren, the Teshkatik, the Keles), which in their lower courses fertilize the wide plains of loess extending from the right bank of the Syr. These plains and their rich supply of water have been the

¹ Redneed from Mushketoff's "Geological Map of the Turkestan Basin," in his *Turkestan* (Russian), 1886, vol. i.

² *Syr* and *darya* both signify "river," in two different dialects.

cause of an crisis of Moslem civilization developing between the barren sands of the Aral depression and the mountain tracts of the Tian Shan. The Angren rises beneath the highest parts of the Tchohtai range, and its valley is the granary of the region. The Tchnitchik has its origin in the Borolday Mountains at the junction of the Tchohtai and the Pskem rivers, and at the point where it issues from the mountains it sends off the famous canal Zakhariyk. It flows past Tashkend along a valley 20 miles wide and joins the Syr a few miles below its confluence with the Angren. The Keles comes from the Jity-su Mountains and also brings a large volume of water for irrigation. But owing to wars and continual insecurity cities formerly important have now been abandoned, and near Tchinnaz, at the mouth of the Tchnitchik, are the ruins of a large town formerly fortified with high walls, and of *ancient* with manifold ramifications.

Some 70 miles below Tchinnaz (770 feet above sea-level) the Syr bends northwards, but resumes its north-westerly course 150 miles further down, following with remarkable persistency the borders of the loess which fringes the mountains. Its low banks, covered with rushes and rendered uninhabitable in summer by clouds of mosquitoes, are inundated for 20 miles on both sides when the snows begin to melt. These inundations prevent the moving sands of the Kizil kum desert from approaching the Syr, below Perovsk, however, the steppe gains the upper hand. Down to Perovsk the river rolls its muddy yellow waters, at the rate of 3 to 5 miles an hour, in a channel 300 to 600 yards wide and 3 to 5 fathoms deep, at Perovsk its vertical section is 8220 square feet, and 312,500 cubic feet of water are discharged per second. The Arys and the Buguiri are the only tributaries worthy of notice on this part of its course, the other streams which descend from the Kara-tau fail to reach the river. The Kungrad Kirghiz rear numerous herds of cattle and sheep in the valley of the Arys, while lower down, as far as Julek, the Igintchis carry on agriculture. All this applies, of course, only to the right bank, on the left the moistness is absorbed by the hot winds which cross the Kizil kum sands towards the river. The dryness of the atmosphere makes its influence markedly felt on the Syr when it enters, below Julek, a region where the Kara-kum sands extend on its right. Ten miles below Perovsk the river traverses a marshy depression—the bottom of a lake not yet fully dried up—where it divides into two branches—the Jaman-daria and the Kira-nyzak. The latter spreads out in marshes and ponds, from which it again issues to join the former at Kaimaktchi, after a course of 80 miles. The main branch also, owing to its shallowness and sinuosity, is very difficult to navigate, and this is increased by the rapidity of the current and the want of fuel. Between Kazalinsk and the Sea of Aral (158 feet) the navigation becomes somewhat easier, except for the last 10 miles, where the river divides into three shallow branches before entering the "Blue Sea". All three have at their mouths sandy bars with only 3 feet of water, which are often forded by the Kirghiz.

Two former right hand tributaries of the Syr—the Tchu and the Sary su—which now disappear in the sands some 60 miles before reaching it, must be mentioned. The Tchu, which is 600 miles in length, rises in the Tian-Shan to the south west of Lake Issik-kul, and is made up of many streams, of which the Kyz art, the Inan ark, and the Koshkar are the more important. On their union these form the Koshkar, which flows towards Lake Issik kul, but a few miles before reaching that lake turns suddenly to the north west, enters under the name of Tchu the narrow gorge of Buun, and, piercing the snow-clad Kunghei Ala tau, emerges on its northern slope, having descended from 5500 feet to less than 2000 in a course of not more than 50 miles. In this part of its course it receives from the right the Kabin, whose high valley equals in size that of the upper Rhone. It then flows north west-

wards through the valley of Pishpek, and, avoiding the Muyn kum sands, describes a wide curve to the north before finally taking a western direction. Numberless streams flow towards it from the snow clad Alexandrovsk Mountains, but they are for the most part lost in the sands before reaching it. The Tatas, 170 miles long, formerly an affluent of the Tchu, which rises in the highest parts of that range, pierces the Tcha archa Mountains, and, flowing past Anhe ata on the south border of the Muyn kum, enters the salt lake Kari kul 60 miles from the Tchu. The Tchu reaches the Summal kul group of lakes, 60 miles from the Syr, in the form of marshes with undefined channels. Another elongated group of lakes—the Uzun kul—near the above and 50 miles from Perovsk, receives the Sary su, which has a length of nearly 570 miles, and flows rapidly in a narrow channel along the west borders of the northern Kamino Steppe (Bekpak-dala).

The delta of the Syr at present begins at Perovsk, whence it sends a branch to the south west, the Yany darra (Jany darra or Jany river), which formerly reached the south eastern corner of the Sea of Aral, very near the mouth of the Amu-darya. The Kirghiz affirm that a canal dug for irrigation by the Karakalpaks gave origin to this river. It had, however, but a temporary existence. A dam erected by the Khokandese at Ak mitchet (Perovsk) caused its disappearance, and the Russians found but a dry bed in 1820. When the dam was removed the Yany darra again reappeared, but it failed to reach the Sea of Aral, in 1853 it lost itself in Lake Kutchika-denghiz, after a course of 250 miles, all traces of its bed were then lost in the sand. The Kirghiz legend can only be accepted, however, with very great caution, the present writer is inclined to think that the canal of the Karakalpaks was merely intended to redirect the waters of the Syr into a channel which existed of old, but had been dried up. Certain it is that five centuries ago, in the time of Timur, the Yany darra brought the waters of the Syr to the Dzu kara Lakes, close by the present mouth of the Amu. The series of old beds in the Kizil kum, which are still seen above Perovsk, shows that the Syr had a constant tendency to seek a channel to the south west and that its present delta is but a vestige of what it was in past times. At a still more remote period this delta probably comprised all the space between the Kari tau and the Nura tau, and in the series of elongated lakes at the base of the Nura tau—the Tuz kano and Boglan ata Lakes—we see an old branch of the delta of the Syr which probably joined the Zerafshan before reaching the Amu. The causes of this immense change are to be sought for simply in the rapid desiccation of the whole northern and central parts of Asia, due to the fact that we are now living in the later phase of the Laenstrine period, which has followed the Glacial period. The extremely rapid desiccation of the Sea of Aral is proved even by surveys a few decades old, and this process is but a trifle in comparison with the changes which have taken place during the last few centuries: the extension of the Caspian Sea as far as the Sarakamish lake during the Post Pliocene period and the extension of the Sea of Aral at least 100 miles to the east of its present banks are both proved by the presence of Post Pliocene marine deposits. (P. A. K.)

SYR-DARIA, or SYR-DARIANSK, a province of Russian Turkestan, in Asia, comprising wide tracts of land on both sides of the Syr-Daria river, from its entrance into the Sea of Aral up to Khoyend, where it issues from the mountain region of the Tian-Shan. It is bounded on the N by the Russian provinces of Turgai and Akmolinsk, on the E. by Semiretchensk and Ferghana (ex-khanate of Khokand), on the S by the district of Zerafshan, Bokhara, and the Russian province of Amu-darya, and on the W by the Sea of Aral. Its area (166,000 square miles), its population (more than one million inhabitants), and its cities (Tashkend, Khoyend, Jizak, &c) make it the most important province of Russian Turkestan, and from its position between the mountain region of Central Asia and the great lake of the west Asian depression it is a region of deep interest for the geographer and geologist.

The south-eastern border of the province runs along the lofty Tchohtai Mountains. This chain, which separates the river Tchohtai from the Narva, and runs for more than 200 miles from south-west to north-east, joining Alexandrovsk Mountains on the east, raises its snow-clad peaks to an altitude of 14,000 feet. It diminishes in height towards the south, not exceeding 7000 feet in the barren Mogol-tau Mountains, but seems to be continued to the south-west by the Baisnu-tau. A series of shorter chains—

¹ For the old beds of the Syr and the Amu, see Kaulbars's "Lower Parts of the Amu," in *Mem. Russ. Geogr. Soc.*, Phys. Geogr., ix. (1861).

the Taġas Ala-tau, the Bishkek, the Badam Mountains, the Kazyk-urt, and the Atym-tau—fringe the above on the north-west, and occupy the south east corner of Syr Daria msk. The snowclad summits of the Taġas Ala-tau range from 14,000 to 15,000 feet, and immense glaciers occur about Manas Mountain. So far as our maps show, the range seems to run from west-south-west to east-north-east. The other chains just mentioned have a decidedly south westerly direction, and are much lower, the outlying ranges having rather the character of broad plateaus, above 2000 feet in height, where the Kirghiz find excellent pasture grounds. Some of them, such as the Kazyk-urt, rise as isolated mountains from the steppe, and have therefore been called Ararats. The Kara-tau is quite separate from the preceding and runs at right angles to them—that is, from north west to south-east. It belongs therefore to another series of upheavals which prevails in western Asia and to which Richthofen has given the name of the "Kara tau series." Its length is about 270 miles, and its average height about 5000 feet, rising at some points to 6000 and 7000 feet. It separates the Syr-Daria from the Tchu, and its gentle south western slope contains the sources of a multitude of streams, which water the oasis around the town of Turkestan. Another range, having the same direction, from north-west to south east, touches the southern border of Syr-Daria, namely, the Nura-tau (or Nuratyn-tau), also called Turkestan Mountains, which lifts its icy peaks (15,000 to 16,000 feet in height) abruptly from the steppe. It separates Syr Daria from Zerāfshan, and the passes by which it is crossed reach an altitude of from 10,000 to 13,000 feet. Finally, a few islands of metamorphic or granitic rock, called Ararats by the natives, stand isolated in the steppes.

The mountainous tracts occupy, however, only a small part of Syr Daria, the rest of its wide surface is steppe. Three different areas must be distinguished,—the Kizil kum, the Mynun kum or Ak kum, and the Kara kum ("black sands," so called more from their desert character than from their colour). The Kizil kum (red sands) is the most interesting.¹ These sands occupy the wide stretch between the Amu and the Syr, and have a gradual ascent from 160 feet at the Sea of Aral to 1500 and 2000 feet in the south east. They are covered with numerous folds or elongated dunes (*barhans*), partly shifting partly stationary, 30 to 60 feet high, and mostly parallel to each other, amidst which are immense spaces covered with clay, and saline clays appear here and there on the surface. The Kizil kum varies much in its characteristics. Close by the Sea of Aral it is covered with shifting sands, the result of the disintegration of eretaceous sandstones, and every storm raises clouds of hot sand which render communication exceedingly difficult. But even there a rich verdure covers the undulations in spring. Farther east the sands lose their shifting character, and the barhans are covered with a kind of *Carex*, which serves as excellent food for sheep. The *Holoxylon Anemodendron* grows extensively on the elevated ridges and yields fuel and charcoal, which last is exported to Bokhara. In the west the surface is covered with remains of Aral Caspian deposits. As the Tian Shan is approached the steppe takes another character, a thick covering of loess girdles the foothills and forms the fertile soil to which Turkestan is indebted for its rich fields and gardens.

The Kara kum sands, situated to the north east of the Sea of Aral, are manifestly a former bottom of the lake. They are covered with debris of *Cardium edule*, *Mytilus*, *Dreissena polymorpha*, *Acerina littorata*, *Adacna vitrea*, *Hydrobia stagnalis*, with remains of marine *Alga* (*Zostera*), and with fragments of *Scirpus* and *Phragmites*. The Kizil kum is characterized by the presence of *Lithoglyphus caspius*, *H. stagnalis*, *Anodonta ponderosa*, and the sponge *Metchnikowia tuberculata*. The evil reputation of the Kara kum has been exaggerated to some extent, the harsh things said of it apply only to the neighbourhood of the Sea of Aral. In the east the steppe has some vegetation and is readily visited by the Kirghiz. The barhans do not shift, being covered with *Caligonum*, *Tamarix*, *Holoxylon Anemodendron*, and some rushes, shifting dunes 40 to 50 feet high occur, especially towards the Sea of Aral. The Mynun kum or Ak kum Steppe, between the Kara tau Mountains and the Tchu, is quite uninhabited, except in the loess region at the northern base of the mountains.

Granites, gneisses, syenites, porphyries, and various meta-

morphic slates constitute the bulk of the western Tian-Shan Mountains. They appear also in the Kara tau and Nurtau, and some tracts in the form of isolated islands in the steppe. Silver and lead ores, as well as malachite and copper ore, are found in them, especially in the Mogol tau, and turquoises about Khojend. The crystalline rocks, much metamorphosed, especially in the west, are overlain by thick Devonian and Carboniferous deposits. Jurassic rocks (Khar tie) cover small areas on the slopes of the mountains. These last are all of fresh water origin, hence it would seem that throughout the Jurassic and Triassic periods Turkestan was a continent intersected only by lagoons of the Turgian sea. The Jurassic deposits are most important on account of their coal beds, which occur in the basins of the Badam and Sairan and in Ferghana. Chalk and Tertiary marine deposits are superimposed upon the above to the thickness of 2000 to 5000 feet, and are widely spread, although they have suffered greatly from denudation. The former belong to the Upper (Ferghana deposits, much resembling Senonian) and Middle Chalk, and contain phosphorite, gypsum, and apatite (in the Amu Darya basin). The Tertiary deposits, which contain gypsum and lignite are represented by micaceous sands around the Sea of Aral and by Oligocene and Miocene (Sarmatian) deposits. In the Tian Shan the red Tertiary conglomerates (Pliocene?) attain a great development. Throughout the Chalk and earlier Tertiary periods the lowlands of Syr Daria were under the sea. The character of the region during the Post Pliocene period remains unsettled. To what extent the mountains of the western Tian Shan were under ice during the Glacial period remains a subject of controversy among geologists, many deposits, however, have been described, even in the outer parts of mountain tracts, which have a decidedly Glacial character. A girdle of loess, varying in width from 30 to 50 miles, encircles all the mountain tracts, increasing in extent in Bokhara and at the lower end of the valley of Ferghana. It seems certain that during the Laeustrine period the Caspian was connected by a narrow gulf with the Aral basin, which was then much larger, while another inland sea of great dimensions covered the present Balkash basin, and at an earlier period may have been connected with the Aral basin. Recent traces of these basins are found in the steppes.

The chief river of the province is the Syr Daria (see above), with its tributaries. The frontier touches the eastern shore of the Sea of Aral, and numerous small lakes, mostly salt, are scattered over the sandy plains. A few lakes of alpine character occur in the valleys of the high tracts.

The climate of Syr Daria varies greatly in its different parts. It is most severe in the high treeless *sarts* of the mountain region, and in the lowlands it is very hot and dry. As a whole, the western parts of the Tian-Shan receive but little precipitation, and are therefore very poor in forests. In the lowlands the heat of the dry summer is almost insupportable, the thermometer rising to 111° Fahr in the shade, the winter is severe in the lower parts of the province, where the Syr remains frozen for three months. The average yearly temperature at Tashkend and Kazalinsk respectively is 54° and 44° (January, 28° and 8°, July, 80° and 76°).

The flora and fauna belong to two distinct regions—to Turkestan and to the Aral Caspian depression (see TURKESTAN). The terraces of loess mentioned above are alone available for culture, and accordingly less than 1 per cent. (0.8) of the total area of the province is under crops, the remainder being either quite barren (57 per cent of the surface) or pasture land (42 per cent.). Although cultivation is possible only in a few oases, it is there carried to great perfection owing to a highly developed system of irrigation,—two crops being gathered every year. Wheat and barley come first, then pease, millet, and lentils, which are grown in the autumn. Rice and oats are grown only about Kazalinsk. Cotton is cultivated in the districts of Khojend, Kurama, and Turkestan. Gardening is greatly developed. Sericulture is also an important source of income, nearly 85 tons of silk being produced every year. Cattle breeding is largely pursued, not only by the nomads but also by the settled population, and in 1881 it was estimated that Syr Daria had 242,000 camels, 396,000 horses, 294,000 horned cattle, and 3,200,000 sheep. Fishing is pursued to some extent on the lower Syr. Timber and firewood are exceedingly dear, timber is floated down from the mountains, but in small quantities, trees raised in gardens, dunes, and some coal (the last in very limited quantity) are used for fuel.

The population of the province amounted to 1,109,700 in 1881, of whom 146,300 lived in towns, 326,600 were settled, and 621,600 were nomadic. It is comparatively dense in certain parts, reaching 15 to 31 inhabitants per square mile in Kurama and Khojend, and still more in the valley of the Teshkent. Its ethnographical composition is very mixed. The Russians barely number 5500, if the military be left out of account, they live principally in towns and about Kazalinsk. Kirghiz (709,400 with the Kara Kirghiz) and Sarts (211,000) are the main elements of the population, 50,000 Tadzhiks, 26,000 Uzbeks, 4500 Tatars, about 77,000 kuramints (settled Kirghiz mixed with other elements), and a few Jews, Persians, and Hindus must be added. The chief occupations of the Sarts, Uzbeks, Tadzhiks, and kuramints are agriculture and

¹ Comp. J. Mushketoff's *Turkestan*, vol. 1.

gudemng, while the Kirghiz chiefly lead a nomadic pastoral life. Manufactures are represented by a few distilleries, but a great variety of petty industries are practised in the towns and villages. Trade is carried on very largely.

Syr Daria is divided into eight districts, the chief towns of which, with their populations in 1881, were—TASHKAND (*q v*) (100,000), Andkuta (4450), Jizak (8700), Kзылinsk (2950), Khojend (28,000), Plovsk (3400), Tchemkent (8050), and Tchemnaz (300). Turkistan or Agret (6700) and Ura tube (11,000) also deserve mention. (P A K)

SYRIA Etymologically, "Syria" is merely an abbreviation of "Assyria," a name which covered the subject-lands of the Assyrian empire, the subject-peoples being also called "Syrians." Afterwards, in the Greco-Roman period, the shorter word came to be restricted to the territory west of the Euphrates,—the designation "Syrians," however, being given to the great mass of the Semitic populations dwelling between the Tigris and the Mediterranean, who are more accurately called Aramæans (Gen x 22, comp SEMITIC LANGUAGES, vol xvi p 645 *sq*). The present article deals with Syria only in its geographical significance. For a map, see vol xvi pl VIII.

Boundaries and extent

Syria is the designation of the country which extends for about 380 miles (between 36° 5' and 31° N lat) along the eastern shore of the Mediterranean, its eastern limit properly speaking is formed by the middle portion of the course of the Euphrates, but in point of fact it insensibly merges into the steppe country which naturally belongs more or less to Arabia. It is only the oases lying nearest the western border of the steppe (*eq*, Aleppo, Palmyra) that can be reckoned as belonging to Syria.¹ From time immemorial the land between Egypt and the Euphrates has been the battlefield for the empires of western Asia on the one hand and those of Egypt and Africa on the other. It has also been the territory which the trading caravans of these empires have had to traverse, and by its position on the Mediterranean it has been the medium for transmitting the civilizing influences of the East to the West and again of the West to the East. Hence it is easy to understand how the peoples of Syria should only in exceptional cases have played an independent part either in politics or in art and science, none the less on that account is their place in history one of the highest interest and importance.

Orography

The surface configuration of the country is a uniform one, the mountains for the most part stretch from north to south in parallel ridges, connecting the Cilician Taurus with the Red Sea range. The continuity is broken for short intervals at one or two points. Immediately connected with the Cilician Taurus in the north, and forming part of it, is the Alina Dagh (ancient Amanus). At its highest it does not rise much above 6000 feet, but it has an abrupt descent towards the sea, and terminates at its southern extremity in a bold headland, the Râs el-Khanzîr. Here the Orontes reaches the sea through a depression in the chain, and the same outlet forms an important pass into the interior of the country. Frequently in ancient times it was only the territory to the south of the lower Orontes valley that was reckoned as constituting Syria. Farther south is the isolated Jebel Akra', about 6000 feet high (the Mons Casius of the ancients), which was held sacred by the Phœnicians, still farther to the south are the low Ansari Hills, which derive their name from the people inhabiting them. Beyond those the Nahr el-Kebir (Eleu-

therus) falls into the sea, and here north Syria may be held to terminate. To the south of this begins the Lebanon district (see LEBANON, vol xiv p 393), an imaginary line drawn eastwards from a point a little to the south of Tyre will represent the southern boundary of what may be designated as middle Syria. Occasionally Syria is spoken of in a narrow sense, as distinguished from Palestine, but there is no scientific ground for such a practice, for the mountains of PALESTINE (*q v*), the southern third of Syria, can be described as a southward continuation of the mountain masses already referred to, and cis-Jordanic as well as trans-Jordanic Palestine is simply a portion of Syria. Indeed the district as far as Sinai can be spoken of as a fourth division of the same country. A glance at a geological map reveals this very clearly. Cretaceous limestone constitutes the bulk of the hills and plateaus of Syria, and extends towards Sinai, where the zone of primitive rocks is reached. In the south of Palestine, nummulitic limestone and Nubian sandstone make their appearance from Sinai and northern Arabia. In addition to these, alluvial soils are principally met with. In middle Syria especially, eastwards from the upper course of the Jordan, great basaltic masses occur, in the Hamran (comp BASHAN, vol iii p 410) there are basalt peaks nearly 6000 feet in height. The basalt mountains are often much broken up so as to be quite inaccessible (Harrâ), but the basalt when decomposed forms the best of arable soils. It is only in isolated cases that the igneous formation extends into western Syria. The tableland to the east of the principal mountain chains consists partly of good clay soil, the steppe (*bâhiyet esh-sham*, also called *hamâd*), which has an average elevation of about 1800 feet, extends towards the Euphrates with a gradual slope.

The direction of the principal valleys is determined by that of the mountains. The chief river of Syria in the narrower sense is the Orontes (Arabic *El Afi*), which rises in the Bekâ', the mountain valley between Libanus and Anti-Libanus, and follows a northerly course. At Antioch, where it is augmented by the stream which flows from the great lake of Ak-Deniz, it turns westwards, falling into the sea near the ancient Seleucia. Not far from the source of the Orontes is that of the Litani (formerly Lita), which runs southwards through the Bekâ', and afterwards westwards through a deep gorge of its own excavation, having its mouth a little to the north of Tyre, in its lower course it bears the name of El Kasmiye. The principal river of south Syria is the JORDAN (*q v*). Like it, most of the other streams of Syria rising on the eastern side of the watershed terminate in inland lakes. Of these may be named the Ak-A'way and the Barada (Pharpar and Abana) of Damascus, which lose themselves in the lakes and marshes to the east of the city. In like manner the river of Aleppo falls into the lake El Math. The 'Afrîna (Ufrenus of the ancients) falls into the Ak-Deniz lake, and so into the Orontes, the Sadjur is a tributary of the Euphrates. Other lakes are the great salt lake to the south east of Aleppo and the remarkable lake near Homs, in the neighbourhood of which the ruins of the old Hittite city of Kadesh have recently been discovered. The coastal streams have been enumerated under LEBANON and PALESTINE (*q v*).

Two distinct floral regions meet in Syria (comp LEBANON). That Vegetation of the coast is Mediterranean, and is characterized by a number of evergreen shrubs, with small leathery leaves, and of quickly flowering spring plants. On the coast of Phœnicia (comp vol xviii p 801) and southwards towards Egypt more southern forms of the same vegetation occur, as, for example, *Ficus Sycomorus*, and especially date palms. This region is separated from the easterly one, that of the steppe flora, by the ridge of Libanus and the mountains of Palestine. It is distinguished by the variety of its species, by the dry and thorny character of its shrubs and by its marked poverty in trees. The Jordan valley has on account of its low level a sub-tropical character. As regards cultivated species, Syria is the home of the olive tree, which, like the vine, is found in all parts, but the white mulberry for silk is limited to a small district. Syria is throughout fir from infertile, the district of the Hamran is one magnificent corn-field, while the orchard land about Damascus is renowned far and wide. In former times, however, cultivation was carried on with much greater zeal, and the arrangements for irrigation—a necessity everywhere, especially on the side bordering on the steppe—were much more considerable and more carefully seen to. The numerous ruins on the lands at

¹ In the cuneiform inscriptions Syria is called *Mât Hatti*, "the land of the Cheta," a designation transferred from the north Syrian people of that name (see below) to the region as a whole, *Mât Harri*, the "hinder" or "western" land, denotes more properly the southern portion, but is also used for the whole. By the Arabs it is called *Esh Sham* (more properly *Lah Sham*), "the land on the left hand," as distinguished from *Yemen*, "the land on the right," but the designation originally implied a wider region than the Syria defined above, including as it did a portion of Arabia.

present under cultivation and still more on those to the east of them indicate that the limits of agriculture were once more extensive and the population much denser than at present. During the Roman period frontier fortresses on the edge of the steppe served to check the rapacity and barbarizing influence of the Bedouin hordes.

Climate

Syria presents great diversities of climate. The mountains, though sometimes not absolutely very high, arrest the west winds blowing from the Mediterranean, so that the atmospheric precipitation is much greater on the western than on the eastern slopes. Hence the springs on the eastern versant are fewer, and cultivation is therefore confined to isolated areas resembling oases. The rainfall drains off with great rapidity, the beds of the streams soon drying up again. With historic times the climate, and with it the productivity of the country cannot have greatly changed. At most the precipitation may have been greater, the area under wood having been more extensive. Except for Jerusalem, we have hardly any accurate meteorological observations. There the mean annual temperature is about 63° Fahr., in Beirout it is about 65°. The rainfall in Jerusalem is 36.22 inches, in Beirout 21.66. The heat at Damascus and Aleppo is great, the cooling winds being kept off by the mountains. Frost and snow are occasionally experienced among the mountains and on the inland plateaus, but never along the coast. Even the steppe exhibits great contrasts of temperature: there the rainfall is slight and the air exceedingly exhilarating and healthy. The sky is continuously cloudless from the beginning of May till about the end of October, during the summer months the nights as a rule are dewy, except in the desert. Rain is brought by the west wind, the north west wind, which blows often, moderates the heat. On the other hand, an ozoneless east wind (sirocco) is occasionally experienced—especially during the second half of May and before the beginning of the rainy season—which parches up everything and has a prejudicial influence on both animal and vegetable life. On the whole the climate of Syria—if the Jordan valley and the moister districts are excepted—is not unhealthy, though intermittent fevers are not uncommon in some places.

Ancient Syrians

Of the political relations of Syria in ancient times we know but little. Each town with its surrounding district seems to have constituted a small separate state, the conduct of affairs naturally devolved upon the noble families. At a very early period—as early probably as the 15th century B.C.—Syria became the meeting place of Egyptian and Babylonian elements resulting in a type of western Asiatic culture peculiar to itself which through the commerce of the Phoenicians was carried to the western lands of the Mediterranean basin. Industry especially attained a high state of development, rich garments were embroidered and glass and the like were manufactured. The extent inventories of spoil carried off by the ancient conquerors include a variety of utensils and stuff. The influence exercised at all times on Syrian art by the powerful neighbouring states is abundantly confirmed by all the recent finds. The Syrians were more original in what related to religion: every place, every tribe, had its "lord" (Baal) and its "lady" (Baalat), the latter is generally called Ashtar or Ashtaret. Besides the local Baal there were "the god of heaven" (El) and other deities, human sacrifices as a means of propitiating the divine wrath were not uncommon. But in the Syrian mythology foreign influences frequently betray themselves. Over against its want of originality must be set the fact, not merely that Syrian culture spread extensively towards the west, but that the Syrians (as is shown by recently discovered inscriptions) long before the Christian era exercised over the northern Arabs a perceptible influence, which afterwards, about the beginning of the 1st century, became much stronger through the kingdom of the Nabateans. The art of writing was derived by the Arabs from the Syrians.

Relations with ancient Egypt.

Something about the ancient political and geographical relations of Syria can be gleaned from Egyptian sources, especially in connection with the campaigns of Thothmes III. in western Asia. The Egyptians designated their Eastern neighbours collectively as *Amu*—Syria up to and beyond the Euphrates is called more precisely *Sahi* or *Zahi*, and is regarded as consisting of the following parts:—(1) *Ruteni*, practically the same as Palestine (occasionally Palestine with Coelestria is called *Upper Ruteni*, as distinguished from Lower Ruteni extending to the Euphrates), (2) the land of the Cheta (sometimes reckoned as belonging to *Ruteni*), with Kadesh on the Orontes as its capital, (3) *Nabarina*, the land on both sides of the Euphrates (extending, strictly speaking, beyond the Syrian limits), (4) *Kafu*, the coast land of the Phoenicians (*Fenichu*), along with Cyprus. The Canaanites in general are called *Charu*. From these lands the Egyptian kings often derived rich booty, so that in those days Syria must have been civilized and prosperous. Moreover, we possess enumerations of towns in the geographical lists of the temple of Karnak and in a hieratic papyrus dating about 200 years after Thothmes III. Some of these names can be readily identified, such as Aleppo, Kadesh, Sidon, and the like, as well as many in Palestine. These materials, however, do not enable us to form even a moderately clear conception of the

condition of the country at that time. It is certain that most of the cities are of very great antiquity. It appears that the Cheta Cheta were probably a non-Semitic people and that their power for a time extended far beyond the Syrian limits. Their inscriptions have not yet been deciphered with certainty. Within Syria their kingdom extended westwards from the middle course of the Euphrates to the neighbourhood of Hamath, their capital appears to have been Carchemish. The most prevalent opinion identifies Carchemish with Jerabis on the Euphrates, an identification which is favoured by the recent discovery of important "Hittite" monuments at the place. Before then the so-called "Hamath stones" were the most important inscriptions of the Cheta we possessed, but numerous others as well as various other remains, are now at our command, and show that the influence of the powerful Cheta kingdom extended far into Asia Minor (compare HITTITES). The kingdom disappeared at an early date, but some of the minor Cheta states continued to subsist down to the 12th century B.C.

Next to the Cheta the Arameans were the people who held the Aramaean most important towns of Syria, gradually advancing until at last they occupied the whole country. Of the Aramaean states named in Gen. x. 23, xii. 21, very little is known, but it is certain that Arameans at an early period had their abode close on the northern border of Palestine (in *Minchah*). A great part was played in the history of Israel by the state of Aram Damascus, i.e., the territory of the ancient city of Damascus (see vol. vi p. 700), it was brought into subjection for a short time under David. The main object of the century-long dispute between the two kingdoms was the possession of the land to the east of the Jordan (Hauran, and especially Gilead). Another Aramaean state often mentioned in the Bible is that of Aram Zobah. That Zobah was situated within Syria is certain, though how far to the west or north of Damascus is not known, in any case it was not far from Hamath. Hamath in the valley of the Orontes, at the mouth of the Bekaa valley, was from an early period one of the most important places in Syria according to the Bible, its original inhabitants were Canaanites. The district belonging to it, including amongst other places Riblah (of importance on account of its situation), was not very extensive. In 733 B.C. Tiglath-Pileser II. compassed the overthrow of the kingdom of Damascus, he also took Arpad (Tell Arfad), an important place three hours to the north of Aleppo. Hamath was taken by Sargon in 720. Henceforward the petty states of Syria were at all times subject to one or other of the great world empires, even if in some cases a certain degree of independence was preserved.

The foundation of numerous Greek cities shortly after Alexander's Greek time was of great importance for Syria, ANTIOCH (gr.), founded about 300 B.C. by Seleucus, became the capital of the Syrian kingdom of the Seleucidae. Among other influential Greek towns were Apamea on the Orontes and Laodicea. The Seleucidae had severe struggles with the Ptolemies for the possession of the southern part of Syria (comp. ISRAEL, vol. xiii p. 420).

After having been reckoned for a short time (from 83 to 69 B.C.) under among the dominions of Tigranes, king of Armenia, the country Poman was conquered for the Romans by Pompey (64-63 B.C.). It is impossible here to follow in detail the numerous changes in the distribution of the territory and the gradual disappearance of particular dynasties which maintained a footing for some time longer in Chalcis, Abila, Emesa, and Palestine, but it is of special interest to note that the kingdom of the Arab Nabateans (comp. vol. xvii p. 160) was able to subsist for a considerable period towards the north as far as Damascus. In the year 40 B.C. Syria had to endure a sudden but brief invasion by the Parthians. The country soon became one of the most important provinces of the Roman empire: its proconsulship was from the first regarded as the most desirable, and this eminence became still more marked afterwards. Antioch, adorned with many sumptuous buildings, as the chief town of the provinces of Syria, became in point of size the third city of the empire, its port was Seleucia, surnamed Pieria. The high degree of civilization then prevailing in the country is proved by its architectural remains dating from the early Christian centuries, the investigations of De Vogüé have shown that from the 1st to the 7th century there prevailed in north Syria and the Hauran a special style of architecture,—partly no doubt following Greco-Roman models, but also showing a great deal of originality in details.

The administrative divisions of Syria during the Roman period varied greatly at different times, subjoined is an enumeration of divisions them as they existed at the beginning of the 5th century. (1) Syria Euphratensis, which had for its capital Hierapolis (Syriac *Ḥabōḡ*, Arab *Ḥamḥid*, Gr. *Βαμδύκη*). The kingdom of Commagene, beyond the limits of Syria, belonged to Syria Euphratensis, its capital was Samosata, at the point where the Euphrates leaves the mountains, and it had other important towns on that river, such as Europus (the modern Barbalissus). (2) Syria I, or Coelestria, having Antioch as its capital. The name Coelestria (ἡ κοιλὴ Συρία) originally, no doubt, was applied to the valley between Labanus and Antilibanus, but was afterwards extended

to the district stretching eastwards from the latter range. (3) Syria II, or Syria Salutaris, with Apamea (Arab *Amīya*, the modern Kal'at el Mudik) on the Orontes as capital. (4) Phœnicie Maritima, capital, Tyre. (5) Phœnicie ad Libanum, capital, Emesa (Hims). To this division Damascus and Palmyra belonged, occasionally they were reckoned to Cœlesyria, the middle strip of coast being designated Syrophœnicia. (6, 7, 8) Palestina I, II, and III. For these which from the time of Vespasian had governors of their own, see vol. VIII p. 177. (9) Arabia (capital, Bosra), which embraced all the region from the Hauran to the Aman, and skirted the Jordan valley, stretching southwards to Petra. Through the kingdom of the Nabateans Roman influence penetrated from Syria far into northern Arabia.

Under
Mohammedan
rule

In 616 Syria was subjugated for a brief period by the Persian Chosroes II, from 622 till 628 it was again Byzantine, 636 and the immediately following years saw its conquest by the Mohammedans (see *MONARCHIES*, vol. VIII p. 562). Mo'awiya, the first Ommayyad caliph, chose Damascus for his residence, but in 750 the capital of the empire was removed by the 'Abbasids to Baghdad. Under the early caliphs the Arabs divided Syria into the following military districts (*qonds*): (1) Fihstīn (Palestine), consisting of Judæa, Samaria, and a portion of the territory east of Jordan, its capital was Ramleh, Jerusalem ranking next. (2) Urdun (Jordan), of which the capital was Tabariya (Tiberias), roughly speaking, it consisted of the rest of Palestine as far as Tyre. (3) Damascus, a district which included Baalbec, Tripoli, and Beyrout, and also the Hauran. (4) Hims, including Hamath. (5) Kinnasrin, corresponding to northern Syria, the capital at first was Kinnasrin to the south of Haleh (Aleppo), by which it was afterwards superseded. (6) The sixth district was the military frontier (*al-cawm*) bordering upon the Byzantine dominions in Asia Minor. The struggles of the Mohammedan dynasties for the possession of Syria cannot be gone into here, suffice it to say that throughout their course the country still enjoyed a considerable degree of prosperity.

Turkish
supre
macy

In the crusading period the kingdom of Jerusalem, whose rulers were never able to establish a foothold to the east of the Jordan, extended northwards to Beyrout, next it was the countship of Tripoli on the coast, and beyond that in north Syria was the principality of Antioch. Syria suffered severely from the Mongol invasions (1260), and it never recovered its former prosperity. In 1516 the Ottomans took it from the Egyptian Mamelukes. Under the Turks its administrative divisions again varied at different times, out of the five pashalics of Aleppo, Tripoli, Damascus, Sidon (later Akko), and Jerusalem two vilayets were subsequently formed, having their capitals at Aleppo and Damascus. Quite recently south Palestine has been made a separate vilayet from that of Damascus.

Lang
guages

Rude stone monuments (circles and dolmens) and other prehistoric remains show that Syria must have been inhabited from a very early period. Within historic times a great number of different nationalities have fought and settled within its borders, the majority belonging to the Semitic stock. This last circumstance has rendered possible a considerable degree of fidelity in the tradition of the oldest local names. After the Aramaeans had absorbed what remained of the earlier population, they themselves were very powerfully influenced by Græco-Roman civilization, but as a people they still retained their Aramaean speech. At present an Aramaic dialect largely mixed with Arabic is spoken in three villages on the eastern slope of Antilibanus (in Ma'ula, Bakli'a, and Jub'adin), but this small survival is on the point of disappearing. Throughout the whole country elsewhere the language spoken is Arabic, but with Aramaic elements, especially in the language of the peasants. Ethnographically the Aramaic element of the population admits of being distinguished from the Arabic type, it is specially strong in the mountain districts. The majority of the Christians dwelling in Syria may be regarded as representatives of the Aramaean race. No traces of the earlier races, such as the Canaanites or Phœnicians, can any longer be distinguished, and every trace of the presence of Greeks, Romans, and Franks has completely disappeared.

Arab
elements
of popu
lation

In the Arab immigration, two principal types are to be distinguished,—the pure Arab type of the nomad tribes (Bedouins) and the type of the sedentary town Arabs and peasants, which shows an intermixture of foreign and older elements. The two confront each other in sharp contrasts. Bedouin tribes are scattered throughout the whole country, despising agriculture and the settled life, they are found with their camels, sheep, and goats on the borders of the territories appropriated by the peasants. Being more or less independent of the Government, especially in the district bordering on the steppe, they are able to exact black mail from their sedentary brethren. Taxed thus on both hands, the life of the peasant is economically far from an easy one, hence it should be the duty of Government to restrain the influence of the nomads and to force them as far as possible to form fixed settlements. In this respect the policy of the Turks during the 19th century to ensure the safety of the peasants and of travellers has been on the whole

successful. In the districts bordering on the coast there are no large nomadic tribes, and on the higher plateaus of the cultivated land the power of the Bedouins is much reduced, but south of Palestine and overy where on the edge of the steppe they continue much as before. The most powerful tribe of the Syrian desert is that of the 'Aneze, falling into numerous subdivisions, of which the Ruwala, Wuld 'Ali, Heseine, and Bischer may be mentioned. The tribe, estimated to number 300,000 in all, extends far into Arabia and reaches the Euphrates. The other Bedouin tribes of Syria have for the most part tolerably definite and circumscribed territories. East of the Jordan the best known are the 'Adwan on the Balka and the Banu Sakhr in Moab. The Bedouins to the south of the Dead Sea are called Ahl el Kibla ("the people of the south") in contradistinction to those of the north (Ahl esh Shemal). Finally, there occur sporadically in central and northern Syria nomadic Turkish tribes. Gipsy hordes are also met with in considerable numbers.

The religious as well as the ethnographical types are strongly Rch divergent. The bulk of the population are Mohammedan, the Bedouins have not much religion of any kind, but they profess Islam. Besides orthodox Moslems there are also Shi'ite sects, such as that of the Metawile (especially in northern Palestine), as well as a number of religious communities whose doctrine, combining philosophical and Christian with Mohammedan elements, is the outcome of the process of fermentation that characterized the first centuries of Islam. To this last class belong the Ishmaelites, Nosairians, and especially the Druses (*q v*). In many cases it is obvious that the political antipathy of natives against the Arabs has found expression in the formation of such sects. The Nosairians, for instance, and no doubt the Druses also, were originally survivors of the Syrian population. The Jews are found exclusively in the larger centres of population, in every case they have immigrated back from Europe. The Christians are an important element, constituting probably as much as a fifth of the whole population, the majority of them belong to the Orthodox Greek Church, which has two patriarchs in Syria, at Antioch and Jerusalem. Catholics—United Greeks, United Syrians, and Maronites—are numerous. The mission of the American Presbyterian Church, which has had its centre in Beyrout for the last sixty years, has done much for Syria, especially in the spread of popular education, numerous publications issue from its press, and its medical school has been extremely beneficial. The Catholic mission has done very good work in what relates to schools, institutes, and the diffusion of literature. The Christians constitute the educated portion of the Syrian people, but the spirit of rivalry is producing stimulative effects on the Mohammedans, who have greatly fallen away from that zeal for knowledge which characterized the earlier centuries of their faith.

Accurate statistics of any kind for Syria cannot be had, even Area the area of the land under cultivation is unknown. The returns population are, according to the Turkish official documents, lation only approximations. The total population may safely be put at less than 2,000,000, an official estimate in 1872-73 gave 1,365,680, of whom 976,322 were Mohammedans. Probably, however, this was an under estimate. Reclus (*Nouv. Géogr. Univ.*, Paris, 1884) gives the area of Syria as 183,000 square kilometres (70,688 square miles) and the population as 1,450,000.

From the Egyptian and Assyrio-Babylonian monuments we learn Com that in ancient times one of the principal exports of Syria was mercer timber, this has now entirely ceased. But it continues to export and in wheat, and with good roads the amount could be very largely increased. Other articles of export are silk cocoons, wool, hides, sponges, and fruits (almonds, raisins, and the like), the amounts of cotton, tobacco, and wine sent out of the country are small. The only good harbours are those of Beyrout and Alexandretta (Scauderon). The caravan trade with the East has almost entirely ceased, and the great trade routes from Damascus northwards to Aleppo and eastwards through the wilderness are quite abandoned. The traffic with Arabia has ceased to be important, being limited to the tune of the going and returning of the great pilgrim caravan to Mecca, which continues to have its mustering place at Damascus. The native industries in silk, cotton, and wool have been almost entirely destroyed by the import trade from Europe. The land is poor in minerals, including coal, water power also is deficient, so that the introduction of European industries is attended with difficulties even apart from the insecurity of affairs, which forbids such experiments as the improvement of agriculture by means of European capital. As regards the cultivation of the soil Syria remains stable, but the soil is becoming relatively poorer, the value of the imports constantly gaining upon that of the exports.

SYRIAC LITERATURE

THE literature of Syria, as known to us at the present day, is, with the exception of translations from the Greek and some other languages, a Christian literature. The writings of the Syrian heathens, such as the so-called Sabians (see SABIANIS) of Harrān, which were extant, at least in part, even in the 13th century,¹ seem to have now wholly disappeared. The beginnings of this literature are lost in the darkness of the earliest ages of Christianity. It was at its best from the 4th to the 8th century, and then gradually died away, though it kept up a flickering existence till the 14th century or even later. We must own—and it is well to make the confession at the outset—that the literature of Syria is, on the whole, not an attractive one. As Renan said long ago,² the characteristic of the Syrians is a certain mediocrity. They shone neither in war, nor in the arts, nor in science. They altogether lacked the poetic fire of the older—we purposely emphasize the word—the older Hebrews and of the Arabs. But they were apt enough as pupils of the Greeks, they assimilated and reproduced, adding little or nothing of their own. There was no Al-Fārābī, no Ibn Sīnā, no Ibn Rushd, in the cloisters of Edessa, Ken neshrē, or Nisibis. Yet to the Syrians belongs the merit of having passed on the lore of ancient Greece to the Arabs, and therefore, as a matter of history, their literature must always possess a certain amount of interest in the eyes of the modern student. The Syrian Church never produced men who rose to the level of a Eusebius, a Gregory Nazianzen, a Basil, and a Chrysostom, but we may still be thankful to the plodding diligence which has preserved for us in fairly good translations many valuable works of Greek fathers which would otherwise have been lost. And even Syria's humble chroniclers, such as John of Ephesus, Dionysius of Tell Mahre, and Bar-Hebraeus, deserve their meed of praise, seeing that, without their guidance, we should have known far less than we now know about the history of two important branches of the Eastern Church, besides losing much interesting information as to the political events of the periods with which their annals are occupied.

As Syrian literature commences with the Bible, we first briefly enumerate the different versions of Holy Scripture. The most important of these is the so-called Peshittā (*mappalā pēshītā*), "the simple" or "plain version," the Syriac vulgate. This name is in use as early as the 9th or 10th century.³ As to the Old Testament, neither the exact time nor place of its translation is known, indeed, from certain differences of style and manner in its several parts, we may rather suppose it to be the work of different hands, extending over a considerable period of time. It would seem, however, as a whole, to have been a product of the 2d century, and not improbably a monument of the learning and zeal of the Christians of Edessa. Possibly Jewish converts, or even Jews, took a part in it, for some books (such as the Pentateuch and Job) are very literally rendered, whereas the coincidences with the LXX (which are particularly numerous in the prophetic books) show the hand of Christian translators or revisers. That Jews should have had at any rate a consultative share in this work need not surprise us, when we remember that Syrian fathers, such as Aphraates, in the middle of the 4th century, and Jacob of Edessa, in the latter half of the 7th, had frequent recourse, like Jerome, to the scholars of the synagogue. To what extent subsequent revision may have been carried it is not easy to say, but it seems tolerably certain that alterations were made from time to time with a view to harmonizing the Syriac text with that of the LXX. Such an opportunity may, for instance, have been afforded on a considerable scale by the adoption of Lucian's text of the LXX at Antioch in the beginning of the 4th century (see SEPTUAGINT, vol. xxi, p. 669). On all these points, however, we know nothing for

certain, and may well repeat the words of Theodore of Mopsuestia in his commentary on Zephaniah 1: 6: *ἡμεῖς οὐκ ἔχομεν τὴν Συρίαν παρ' ὅρου δὲ ποτὶ οὐδὲ γὰρ ἔγνωσαν μέχρι τῆς τῆμερος ὥστε ποτὶ οὗτος ἔστιν*.

The canonical books of the Old Testament according to the Canonical Peshittā are substantially those of the Hebrew Bible. In the books of Massoretic MSS (see below), whether Nestorian or Jacobite, the Old Testament books of Chronicles, 1 and 2, and Nehemiah are passed over and in tangent the Nestorian the book of Esther also. But, on the other hand, it must be noticed that all these books are cited by Aphraates, and that they all appear in the *Codex Ambrosianus*. Of the Chronicles there is a MS of the 6th century in the British Museum, Add. 17104. Esther appears in a volume of equal age (Add. 14652) as one of the constituent parts of the "Book of Women," the others being Ruth, Susanna, Judith, and the history of Thekla the disciple of St Paul, which last is excluded from biblical MSS. The oldest dated MS of any portion of the Old Testament at present known to us is Add. 14125 in the British Museum (Gen., Exod., Num., Deut.), transcribed at Amul by a deacon named Iohān in 461. The deuterocanonical books or apocrypha, translated by different hands from the Greek,⁴ are nearly the same as in the LXX. The *Codex Ambrosianus*, for example, contains Wisdom, the Epistle of Jeremiah, and two Epistles of Baruch, the Song of the Three Children, Bel and the Dragon, and Susanna, Judith, Sirachides or Ecclesiasticus, the Apocalypse of Baruch, the fourth book of Esdras, and five books of the Maccabees, the fourth being the history of Samson and his sons, and the fifth *Joseph de Bello Judaeico* lib. vi.⁵ To these must be added from other MSS the first or third book of Esdras, the book of Tobit, and the prayer of Manasses. Of the first book of the Maccabees two recensions are extant, as far as chap. xiv 24. The book of Tobit presents the text of the LXX as far as chap. vii 11.⁶

The canonical books of the New Testament are the four Gospels, Canon the Acts of the Apostles (to which are annexed the three catholic epistles, viz., James, 1 Peter, and 1 John), and the fourteen epistolical books of St Paul. The shorter apostolic epistles, viz., 2 and 3 John, 2 New Testaments, Peter, and Jude, and the Apocalypse of St John, were rejected by the early Syrian Church.⁷

As to the Peshittā version of the Gospels (P), a variety of critical questions arise when we consider it in connection with two other Diatessaronic works, the *Diatessaron* of Tatian (T) and the *Chrestomata Gospels* (G) (Se).⁸ Tatian, the friend of Justin Martyr, afterwards converted and the heretic, composed out of the four Gospels a work which received Canon the title of *Tō diὰ τεσσάρων εὐαγγέλιον*, in Syriac more briefly *Diā tesserōn*, or *Evangelion diā Mēhallēzē*, "the Gospel of the Gospels, Mixed." It is a subject of controversy whether Tatian wrote this work in Greek or in Syriac, and whether he compiled it from the Greek Gospels or from a previous Syriac version. According to Zahn⁹ and Baethgen,¹⁰ the author's language was Syriac, his sources Greek. They hold that this was the only Gospel in use in the Syrian Church for nearly a century, but that about the year 250, under the influence of Western MSS of the Greek

⁴ Mal, *Patrum Nova Bibliotheca*, vol. vii 252.

⁵ Some scholars, such as P. de Lagarde and Bickell, think that Ecclesiasticus was translated from the lost Hebrew text.

⁶ See Ceriani, *Monumenta Sacra et Profana*, vol. i fasc. 1, 2, vol. i fasc. 1, 2, P. de Lagarde, *Libri I et II apocryphi Syriaci*.

⁷ Splendidly reproduced at Milan by the process of photo lithography under the direction of the Rev. Dr. A. M. Ceriani, 5 parts, 1876 fol.

⁸ See *Das Alte Buch d. Judentums übersetzt in 7 russisch bearbeitet*, by Dr. H. Kottel, Berlin, 1886, only parts 1 and 2.

⁹ See the Syriac note on p. xii of De Lagarde's edition.

¹⁰ The principal editions of the Peshittā are contained in the Paris polyglott of Le Jay and the London polyglott of Walton, to which latter is attached the immortal *Lexicon Heptaglotton* of Edmund Castell. The Old Testament (without the apocrypha) was edited by S. Lee in 1823 for the Bible Society, and is frequently bound up with the New Testament of 1828. The first edition of the New Testament was that of J. A. Widmanstad, with the help of Moses of Vardān (Vienna, 1555). Those of Tremellius (1569), Trost (1621), Gutbir (1664), and Lensden and Schaaf (1708, 1717) are well known. To the last named belongs Schaaf's admirable *Lexicon Syriacum Concordantiale*. The American missionaries at Urümiah have published both the Old and New Testaments in ancient and modern Syriac, the former in 1852, the latter in 1846.

text (see Westcott and Hort, *The New Testament in the Original Greek*, Intro, §§ 118, 214), a version of "the Separate Gospels," *Evangelion da Mepharrishê*, was introduced¹ The translator, according to Baethgen² made use of T as far as he could, and of this text Sc is, in the opinion of these scholars, the solitary survival in our days The evidence for this view does not, however, appear to be conclusive It seems that a Syriac version of the four Gospels, as well as of the other parts of the New Testament, must have existed in the 2d century, perhaps even before the version of the Old Testament From this Tatian may have compiled his *Diatessaron* or he may have written that work in Greek and others may have done it into Syriac Be that as it may, T certainly gained great popularity in the early Syrian Church, and almost superseded the Separate Gospels Aphraates quoted it³, Ephraim wrote a commentary upon it⁴ the *Doctrina of Addai* or Addai (in its present shape a work of the latter half of the 4th century) transfers it to the apostolic times⁵, Rabbūlā, bishop of Edessa (411-137), promulgated in order that "the priests and deacons should take care that in every church there should be a copy of the Separate Gospels (*Evangelion da Mepharrishê*), and that it should be read"⁶, and Theodoret, bishop of Cyrrhus (423-457), swept up more than two hundred copies of it in the churches of his diocese, and introduced the four Gospels in their place τα ὡς τε ἀπὸ τῶν εὐαγγελιστῶν ἀντιστοιχοῦν εὐαγγέλια The result of the and similar well merited efforts is that not a single copy of T has come down to our times⁷ Both Aphraates and Ephraim, however, made use of the Separate Gospels The former seems to have employed a text which Baethgen calls a slightly revised form of Sc (*op cit*, p. 95), we would rather speak of it as a revised form of the old Syriac Gospels of the 2d century The latter made use of a more thorough Edessene revision, closely approaching in form to if not identical with, P (Baethgen, p. 95, Zahn, p. 63) Our oldest MSS of P are, however, more than a hundred years later than Ephraim's time We cannot, therefore, expect very important textual results from the collation of even such MSS as Add 14470, 14453, 14459, ff. 1-66, and 17117, in the British Museum, all of which may be safely ascribed to the latter part of the 5th or the beginning of the 6th century Early in the 5th century Rabbūlā, bishop of Edessa, the friend and correspondent of Cyril of Alexandria, occupied himself with "translating the New Testament out of the Greek into the Syriac, because of its variations, exactly as it was"⁸ This probably means, as has been suggested by Nestle, that Rabbūlā undertook a revision of the Syriac text according to a Greek MS or MSS in his possession, that is to say, still further assimilated P of that day to a Greek (possibly, from his connexion with Cyril, Alexandrian) text We do not as yet know, however, whether this revision was merely a private effort, or what influence, if any, it exercised on the history of P, more likely it was a first step in the direction of the Philoxenian version (see below) The result of these successive revisions as regards Sc has been that it survives in but one mutilated codex, and that written at comparatively so late a date as 450-470,¹⁰—a phenomenon which has its parallel in the case of the Itala codex of the Gospels, copied in the 11th century The greater part of this volume is in the British Museum (Add. 14451)¹¹, but there are three leaves of it in the royal library at Berlin forming the folios of the MS marked Orient Quart 528¹² Crowfoot's attempt

* Martins article "Le Jia teograp de Tatlu" (from *Pelle des Quatre* - H.K.r.g.e.s April 1890) contains much curious literary information very particularly regarding similar compilations of later date. See also Cuenca's article "De Tatani Ditesaron Arabica versione in Cardinal Petrus Analer's dixerit Spalen" & several paragraphs. This Arabic *Ditesaron* begins with Mark (1, John), 1-5 Luke 1-50 Matthew 1-25, Luke 1-30. Cienca's copy is now (1890) in the hands of Dr. Lagarde, who has published a few pages of it in *Sachrichten von der Einsiedlung der Wissenschaften* after 1880, No. 4 pp. 170-388. According to Dr. Lagarde, the text is that of the ordinary *Pelle des Quatre*.

Overbeck on ell p 173, 1830
to The whole of the Abb. Martin's elaborate argumentation (Intre i la critique Teruile da T, pp 100-254) is of no avail against this palaeographic fact. No one who is conversant with Syriac MSS can for a moment doubt that our codex of Sc was written within a few years of the time indicated above. The handwritings of Jacob of Eds as a time (the latter half of the 11th century) are altogether different. Possessors of the above work should cancel pp. 234-254. The "Psephismum" as the author himself has explained is only an elaborate note. There is no MS add 70123 in the British Museum, no catalogue of the Greek MSS in twenty five volumes, and of course no such photograph exists as he has described. As for the "special telegram" from Reverend Crowfoot through the "agency" Fri Fro Fro and Co., dated 23th December 1882, it is enough to say that Mr Crowfoot died on 18th March 1883.

11 See Wright Catalogue p 73 No. ex. 1.

to retranslate Se into Greek is a failure (*Fragmenta Evangelica* 1870-72), Baethgen's work (*Evangelienfragmente*, &c) will perhaps be found more satisfactory.

The scholars of the Monophysite branch of the Syrian Church were, however, by no means satisfied even with the revised text of P, and demanded a yet more accurate reproduction of the Greek text in use among them. Accordingly Aḥsēniā or Philoxenus bishop of Mabbūgh (485-519), undertook to satisfy this want, with the assistance of his chorepiscopus, Polycarp, produced a liturgical translation of the whole Bible in the year 508.¹³ This seems first to have met with considerable approval, Moses of Aggel, a monk, who flourished from 550 to 570,¹⁴ refers to the version of the New Testament and of the Psalms evidently as the standard work of the day.¹⁵ But it was in its turn superseded by two later revisions, and MSS of it are now very rare. Portions of Isaiah survive in the British Museum, Add 17106, ff 74-87,¹⁶ and the text of the Gospels in the codex A. 2, 18 of the Biblioteca Apostolica at Rome, of the 11th or 12th century,¹⁷ and perhaps also the Beṛūt (Beyrout) MS described by the Rev Isaac H. Hall.¹⁸ The beginning of the 7th century the work of retranslation and revision was again taken in hand by the Monophysites, the see of their labours being the different convents in the neighbourhood of Alevandria. There, in the years 616-617,¹⁹ Paul, bishop of Tellā dhi Manzēlath or Constantin, undertook a version of the hexaplar text of the LXX at the request of the patriarch Athanasius I.²⁰ Of parts of this many MSS are extant in the British Museum and the Bibliothèque Nationale at Paris, and the Bibliotheca Ambrosiana at Milan possesses the second volume of a codex of the entire work, which has been reproduced by photo-lithography under the direction of Ceram.²¹ This version not only exhibits the asterisks and obeli of Origen's text of the LXX, but the marginal notes contain many readings of the other Greek translators, which have been largely utilized by Field in his noble work *Origines Hexaplorum quæ supersunt* (3 vols., Oxford, 1875). At the same time and place the New Testament of Philoxenus was thoroughly revised by Thomas of Harkel or Heraclius,²² bishop of Mabbūgh,²³ who, being driven from his diocese, betook himself to Alexandria and worked there in the convent of St Antony at the Enaton (or Nine mile village).²⁴ This version comprises not only all the books contained in the Peshittā but also the four shorter epistles.²⁵ The lapse of another century brings us to the last attempt at a revision of the Old Testament in the Monophysite Church. Jacob, bishop of Edessa, undertook, when living in retirement in the convent of Tell Addā or Teleda,²⁶ in 704-705, to revise the text of the Peshittā with the help of the Greek versions at his disposal,²⁷ thus producing a curious eclectic or patchwork text. Of this work there are but five volumes extant in Europe, four of which came from the Nitran Desert and form parts of a set which was written in the years 718-720. It would seem, therefore, never to have attained popularity.²⁸

One other version remains to be noticed, namely, that used by

monks who dwell in the mountains (pp. 113-131). Of metrical writings the same book contains (pp. 339-354) the hymns against Julian the Apostate (pp. 1-20), and the conclusion of the hymns on Paradise (wanting in the Roman ed., vol. iii 598).¹ Other metrical homilies were published by Zingerle,² but far more important, as having a real historical interest, are the *Carmina Nisibena*, or "Hymns relating to the City of Nisibis," edited by Bickell in 1866. These poems, which deal in great part with the history of Nisibis and its bishops and of adjacent cities (such as Anzit or Hanzit, Edessa, and Harrân), were composed, according to Bickell (Introd., p. 6 sq.), between the years 350 and 370 or thereabouts.³ A large quantity of hitherto unpublished matter is also contained in Lamy, *S. Ephraemi Syri Hymni et Sermones*, vol. 1, 1882, and vol. II, 1886,—e.g., fifteen hymns on the Epiphany, a discourse on our Lord, several metrical homilies (in particular for Passion week, the Resurrection, and New or Low Sunday), hymns on the Passover or unleavened bread (*De Azymis*) and on the Crucifixion, acts of Ephraim from the Paris MS. Ancien fonds 144, commentaries on portions of the Old Testament, other metrical homilies, and hymns on the nativity of the Blessed Virgin Mary, Lent, &c. The so-called *Testament of Ephraim*⁴ has been printed in the *Opera Graeca*, II pp. 395-410 (with various readings at p. 493), and again by Overbeck (*op. cit.*, pp. 137-156).⁵

Ephraim's pupils. Notwithstanding his vast fecundity and great popularity as a theological writer, Ephraim seems not to have had any pupils worthy to take his place. In the *Testament* we find mentioned with high commendation the names of Abhâ, Abraham, Simeon, Mârî of Aggâl, and Zenobius of Gêzirtâ,⁶ to whom we may add Isaac⁷ and Jacob.⁸ Two, on the other hand, are named with decided reprobation as heretics, namely, Paulonas (Παυλονας) or Paulinus (Παυλινος) and Arwadh or Arwat.⁹ Of these, Abhâ is cited by later writers and compilers as the author of a commentary on the Gospels, a discourse on Job, and an exposition of Ps. ciii 9.¹⁰ Paulonas or Paulinus is probably the same who is mentioned by 'Abhd ishô'¹¹ as having written "*nadhrâshâ*" or metrical homilies, discourses against inquirers, disputations against Marcion, and a treatise concerning believers and the creed.¹² Zenobius, who was deacon of the church of Edessa, according to the same authority,¹³ composed treatises against Marcion and Pamphilus (?), besides sundry epistles. He was also the teacher of Isaac of Antioch, of whom we shall speak shortly.

Balai and Cyril. Better known than any of these disciples of Ephraim are two writers who belong to the close of this century and the beginning of the next, Balai and Cyrillônâ. The date of Balai or Balæus, chorepiscopus (as it seems) of the diocese of Aleppo, is fixed by his being mentioned by Bar Hebraeus¹⁴ after Ephraim, but before the time of the council of Ephesus (431). Acacius, bishop of Aleppo, whom he celebrates in one of his poems, must therefore, as Bickell says,¹⁵ be the same Acacius who had a share in converting Rabbulâ to Christianity,¹⁶ and died at an extreme old age (it is said 110 years) in 432. His favourite metre was the pentasyllabic, which is known by his name, as the heptasyllabic by that of Ephraim, and the twelve syllabic line by that of Jacob of Sêrigh. Some of his poems have been edited by Overbeck in the often cited collection *S. Ephraemi Syri, &c., Opera Selecta*, pp. 251-336, namely, a poem on the dedication of the newly built church in the town of Keneshirî (Kinnasrîn), five poems in praise of Acacius, the late bishop of Aleppo, the first and eighth homilies on the history of Joseph, specimens of prayers, and a fragment on the death of Aaron.¹⁶ Cyrillônâ composed a poem "on the locusts, and on

(divine) chastisement, and on the invasion of the Huns,"¹⁷ in which he says "The North is distressed and full of wars, and if Thou be neglectful, O Lord, they will again lay me waste. If the Huns, O Lord, conquer me, why do I seek refuge with the martyrs? If their swords lay me waste, why do I lay hold on Thy great Cross? If Thou givest up my cities unto them, where is the glory of Thy holy Church? A year is not yet at an end since they came forth and laid us waste and took my children captive, and lo, a second time they threaten our land that they will humble it." Now the invasion of the Huns took place in 395,¹⁸ and this poem must have been written in the following year (396). The few remaining writings of Cyrillônâ, composed in various metres, have been edited by Bickell in the *ZDMG*, LVII p. 566 sq., and translated by him in Thalhofer's *Bibliothek*, 41, pp. 9-63.¹⁹ Bickell²⁰ is inclined to identify this Cyrillônâ with another writer of the same period, 'Abhsamyâ, a priest of Edessa, Ephraim's sister's 'Abh son and a pupil of Zenobius, but his reasons do not seem to us sufficient. The *Chron. Edess.* (B O, I 401) states that 'Abhsamyâ composed his hymns and discourses on the invasion of the Huns in 404, and Dionysius of Tell Mahrê (B O, I 169) speaks of him in the year 397. Bar Hebraeus is less precise as to the date after mentioning the death of Chrysostom (in 407), he adds that about this time Theodore of Mopsuestia died (429) and 'Abhsamyâ flourished, who "composed many discourses in the (heptasyllabic) metre of Mâr Ephraim" on the invasion of the Huns.²¹ That 'Abhsamyâ may have taken the name of Cyrillônâ at his ordination is of course possible, but it seems strange that none of these three writers should have mentioned it, if such were the case. On Bar Hebraeus's statement regarding the metre which he used in his discourses we do not insist, he might easily make a mistake in such a matter.

During the latter part of the 4th century, too, there lived in Abbot the island of Cyprus the abbot Gregory, who appears to have been Gregory sent thither from some monastery in Palestine as the spiritual head of the Syriac speaking monks in the island.²² He cherished friendly relations with Epiphanius, afterwards bishop of Salamis or Constantia (367-403), and a monk named Theodore. To these are addressed several of his discourses and letters, others are general exhortations to the monks under his charge.²³ The discourses seem to be only portions of a work on the monastic life, which has not come down to us in a complete form, the "book," mentioned by 'Abhd ishô' in B O, III 1, 191. In the letters he addresses Epiphanius as an older man speaking with authority to a younger, it is to be presumed, therefore, that they were written before Epiphanius became bishop.

With the 5th century commences the native historical literature of Syria. Previous to this time there existed martyrologies and saints' lives of saints, martyrs, and other holy men, drawn up in part at least to meet the requirements of the services of the church. Such martyrs are, for example, the ancient martyrology in a manuscript of 411²⁴, the *Doctrine of Addai*, in its present shape a product of the latter half of the 4th century,²⁵ the *Hypomnemata of Sharbîl*, and the *Martyrdoms of Bar samyâ, Bishop of Edessa, and the Deacon Habbûh*, which all belong to about the same period.²⁶ This sort of legendary writing was carried on to a much later date.²⁷ The *History of Bêth Sêlâh and its Martyrs*, for instance, can hardly have been composed before the 6th century, if so early,²⁸ and the *Acts of Mârî* must be still later.²⁹ No larger collection of such documents had, however, been attempted before the time of Mârûthâ, bishop Mârûthâ of Maiperkat,³⁰ a man of much weight and authority, who was of Mal twice sent by the emperor Theodosius II. on embassies to the Persian monarch Yazdegerd I., and presided at the councils of Seleucia or Ctesiphon, under the catholics Isaac and Yabî al'ihû.

¹ The last hymn (p. 351) is genuine, as the very fact of its being an acrostic shows (see Bickell, *Conspicuum*, p. 19) whereas the metrical homily on the baptism of Constantine (pp. 355-361) is certainly spurious (Bickell, loc. cit.).

² *S. P. Ephraemi Syri Sermones duo*, Brixen, 1869 (see B O, I 149, col. 1 No. 81). Monumenta Syriaca ex Romanis Codicibus collecta, I. 4 (B O, loc. cit. No. 30). Zingerle has rendered many of Ephraim's works into German e.g., *Die heilige Mene der Syrer*, Gesänge des h. Kirchenrâters Ephraem, 1833. *Gedänge gegen die Grâbler über die Geheimnisse Gottes*, 1834. *Festkrânze aus Libanons Gärten*, 1846. *Des h. Kirchenrâters Ephraem ausgewählte Schriften*, aus d. Griechischen und Syrischen neubersetzt 6 vols., 2d ed., 1846-47. *Die Reden des h. Ephraem gegen die Ketzer*, 1850. *Reden des h. Ephraem des Syriers über Selbstverleugnung und einsame Lebensweise*, mit einem Lrleife desselben an Einsiedler, 1871. Translations into English have been attempted though with less success by Morris (*Select Works of S. Ephraim the Syrian*, 1847) and Burgess (*Select Metrical Hymns and Homilies of Ephraim Syrus*, 1883, *The Repentance of Ninveh*, &c., 1888).

³ Comp. Bickell, *Conspicuum*, p. 29 note 21. ⁴ See B O, I 141, No. 8. ⁵ That it has been interpolated by a later hand is shown by the long and purposeless digression on Moses and Pharaoh (Op. Gr., II 400) and the story of Lamprotat at the end (ibid. p. 400), as also by the stanzas regarding the vine which Ephraim saw growing out of his mouth when he was an infant (ibid. p. 403). ⁶ B O, I 383 144. ⁷ Ibid., I 105.

³¹ Called by the Greeks Martyropolis, in Syriac Mârûthâ Sâhid, and by the Arabs Ma'yâfûrîkîn.

respectively.¹ He is said, too, to have been a skilful physician.² To him 'Abhd ishō' assigns the following works,³—A book of martyrdoms, anthems and hymns on the martyrs, and a translation of the canons of the council of Nicaea, with a history of that council.⁴ The last named of these he undertook at the request of Isaac, orthodox of Seleucia, who died in 416.⁵ The canons which pass under his name are those of the council of Seleucia in 410.⁶ But his great work was the *Book of Martyrs*, containing accounts of those who suffered for the Christian faith under Sapor II, Yazdegerd I, and Bahrām V, to which he prefixed two discourses on the glory of the martyrs and on their torments. One of these narratives claims to have been recorded by an eye witness, Isaiah, the son of Hadhlō (or Hadhablō), of Arzan ('Apfaryn'), one of the Persian king's horsemen.⁷ Portions of this work survive in the British Museum in MSS of the 5th and 6th centuries, as well as in some of later date both there and in the Vatican. They have been edited by S. E. Assemani in the first volume of the *Acta Sanctorum Martyrum*, 1748.⁸ The commentary on the Gospels mentioned by Assemani is really by Māruthā, the maphrān of Taghrith (Tikrit), who is also the author of the anaphora or liturgy.⁹ Of him we shall have occasion to speak afterwards (see p. 833 *infra*). It is possible too that some of the above mentioned Acts may belong not to the work of Māruthā but to that of Abi, the successor of Isaac in the see of Seleucia, who likewise wrote a history of the Persian martyrs and a life of his teacher 'Abhdā, the head of the school in the monastery of Dūr Kōnī or Dair-Kunnā (where the apostle Mārī was buried).¹⁰

Nestorianism About this time evil days came upon the Christian church in Syria. Paul of Samosata, Diodore of Tarsus, and Theodore of Mopsuestia had paved the way for Nestorius. The doctrines of these writers were warmly espoused by many of the Syrian theologians, and the warfare raged for many years in and around Edessa, till it ended in the total destruction of the great Persian school by the order of the emperor Zeno (483-489).¹¹

Rabbūlā Rabbūlā, a native of Ken neshrīn (Kennesrin), whose father was a heathen priest but his mother a Christian, was converted to Christianity by Eusebius, bishop of Ken neshrīn, and Acacius, bishop of Aleppo. He voluntarily gave up all his property, forsook his wife, and became a monk in the convent of Abraham near his native city. On the death of Diogenes, bishop of Edessa, he was appointed his successor (411-412). His admiring biographer depicts him as a model bishop, and he certainly appears to have been active and energetic in teaching and preaching and attending to the needs of the poor.¹² In the theological disputes of the day he seems at first to have sided, if not with Nestorius, at least with those who were averse to extreme measures, such as John, patriarch of Antioch, and his partisans, but afterwards he joined the opposite party, and became a warm champion of the doctrines of Cyril, which he supported at the council of Edessa (431). From this time onward he was a staunch opponent of Nestorianism, and even resorted to such an extreme measure as burning the writings of Theodore of Mopsuestia. Hence Ibas in his letter to Mārī speaks of him as "the tyrant of Edessa," and Andrew of Samosata, writing to Alexander of Hierapolis in 432, complains bitterly of his persecution of the orthodox (i.e., the Nestorians). He died in August 435.¹³ Of the writings of Rabbūlā but little has come down to us. There is a sermon extant in manuscript,¹⁴ enjoining the bestowing of alms on behalf of the souls of the dead and prohibiting all feasting on the occasion of their commemoration. Another sermon, preached at Constantinople, is directed against the errors of Nestorius.¹⁵ There are also extant canons and orders addressed to the monks and clergy of his diocese,¹⁶ and a number of hymns, of which Overbeck has printed some specimens.¹⁷ He also rendered into Syriac Cyril's treatise *De Recta in Dominum nostrum J. C. Fide ad Theodosium Imperatorem* from a copy which was sent to him by the author.¹⁸ His biographer intended to translate into Syriac a collection of forty six of his letters, written in Greek "to priests and emperors and nobles and monks,"¹⁹ but of these only a few remain, e.g., to Andrew of Samosata, condemning his treatise against the twelve anathemas of Cyril,²⁰ to Cyril, regarding Theodore of Mopsuestia,²¹ and to Gemellinus of Perrhē, about certain monks and other persons who misused the sacred elements as ordinary food.²²

Rabbūlā was succeeded in the see of Edessa (435) by Ishbhā or Ibas. Ishbhā (Greeclized Ibas),²³ who in his younger days had been one of the translators of Theodore's works in the Persian school.²⁴ This, with his letter to Mārī the Persian,²⁵ and other utterances, led to his being charged with Nestorianism. He was acquitted by the two synods of Tyre and Beirut, but condemned by the second council of Ephesus (449).²⁶ and Nounus was substituted in his room. He was restored, however, at the end of two years by the council of Chalcedon, and sat till October 457, when he was succeeded by Nounus,²⁷ who in his turn was followed by Cyrus in 471. Besides the writings above mentioned, 'Abhd ishō' attributes to Ibas²⁸ "a commentary on Proverbs, sermons and metrical homilies (*madhrāshē*), and a disputation with a heretic," but none of these appear to have come down to us.

During this stormy period the name of Acacius, bishop of Amid, Acacius is mentioned as the author of certain epistles.²⁹ The great event of his life, which is referred by Socrates (bk. vii. 21) to the year 422, is thus briefly recorded in the *Martyrologium Romanum Gregor. XIII.* (Malines, 1859), 9th April "Amida in Mesopotamia sancti Acacii episcopi, qui pro redimendis captivis etiam ecclesie iasa conflavit ac vendidit." The said captives were Persian subjects, who were thus ransomed and sent back to their king and country.³⁰ Acacius was doubtless a favourer of Nestorianism, for his letters were thought worthy of a commentary by Mārī, bishop of Beth Haradashēr,³¹ the correspondent of Ibas.³²

About the same time rose one of the stars of Syriac literature, Isaac, commonly called the Great, of Antioch.³³ He was a native Antiochian, but went as a young man to Edessa, where he enjoyed the teaching of Zenobius, the disciple of Ephraim.³⁴ Thence he removed to Antioch, where he lived as priest and abbot of one of the many convents in its immediate neighbourhood. In his younger days he would seem to have travelled farther than most of his countrymen, as it is stated that he visited Rome and other cities.³⁵ With this agrees what is recorded by Dionysius of Tell Mahrō³⁶ as to his having composed poems on the secular games celebrated at Rome in 404, and on the capture of the city by Alarie in 410, which shows that he took a more than ordinary interest in the Western capital. Isaac died in or about 460, soon after the destruction of Antioch by the earthquake of 459, on which he wrote a poem.³⁷ Isaac's works are nearly as voluminous and varied as those of Ephraim, with which indeed they are often confounded in MSS and in the Roman edition.³⁸ They were gathered into one corpus by the Jacobite patriarch John bar Shūshān or Susanna, who began in his old age to transcribe and annotate them, but was hindered from completing his task by death (1073).³⁹ Assemani has given a list of considerably more than a hundred metrical homilies from MSS in the Vatican.⁴⁰ Of these part of one on the Crucifixion was edited by Overbeck,⁴¹ and another on the love of learning by Zingerle.⁴² But it has been left to Bickell to collect and translate all the extant writings of this Syrian father and to commence the publication of them. Out of nearly 200 metrical homilies his first volume contains in 307 pages only fifteen, and his second brings

²³ B.O. i. 190. ²⁴ *Ibid.*, iii. 1. 8. Wright Catal., pp. 107, col. 2, 644, col. 1. ²⁵ See Labbe, *Concil.*, ix. 51. Mausi, vii. 241.

²⁶ The so-called *Ἀποστολικὴ συνόδος* or *laetecinium Ephesinum*. Of the first session of this council a portion is extant in Syriac in Brit. Mus. Add. 12158, ff. 51b-51a (written before 602), containing the acts in the cases of Ibasian of Antioch and Eusebius of Dori laum. Add. 14550 (interf. 55a.) contains the second session comprising the acts in the cases of Ibas, his nephew Daniel of Harrān, Irenaeus of Tyre, Aquilinus of Babilus, Sophronius of Tellā ar Constantinā, Theodore of Cyrrhus, and Damius of Antioch. These documents have been translated into German by Hoffmann *Verhandlungen der Kirchenversammlung zu Ephesus am xlii. August 449*, &c., 1873. Into French by Marlin, *Actes du Briganlage d'Ephèse*, 1874. and into English (with the assistance of a German scholar) by the Rev. S. G. F. Perry, *The Second Synod of Ephesus*, 1881. See also Marlin, *Le Pseudo-Synode connu dans l'Histoire sous le nom de Briganlage d'Ephèse*, &c., 1875. and Perry, *An Ancient Syriac Document purporting to be the record of the chief features of the Second Synod of Ephesus*, &c., part I, 1867. Mr Perry printed a complete edition of the Syriac text at the Clarendon Press, Oxford, but no one seems to know what has become of the copies. The copies of the English translation were purchased at the sale of Mr Perry's library by Mr Quaritch.

us in 353 pages only as far as No. 37.¹ Some of these poems have a certain historical value, such as the second homily on fasting, probably written soon after 420,² the two homilies on the destruction of the town of Bēth Hār by the Arabs (c. 457),³ and the two against persons who resort to soothsayers.⁴ Others possess some interest as bearing on the theological views of the author, who combats the errors of Nestorius and Eutyches.⁵ One of the longest and most wearisome is a stupendous poem of 2137 verses on a parrot which proclaimed *ḏyos ḏ ʿōbē* in the streets of Antioch.⁶ Another on repentance runs to the length of 1929 verses. In prose Isaac seems to have written very little, at least Bickell⁷ mentions only "various questions and answers, an ascetic narrative and ascetic rules."

Dādā. Concerning Isaac's contemporary Dādā we know but little.⁸ He was a monk from the neighbourhood of Amid, who was sent by the people of that city to Constantinople on account of the ravages of war and famine, to obtain remission of the taxes or some similar relief, and was well received by the emperor. He is said to have written about three hundred tracts on various topics connected with the Scriptures and on the saints, besides poems (*madhrāshē*).

Simeon the Stylite. Here, too, we may record the name of Simeon the Stylite, who died in 459 or soon after.⁹ The Monophysites contend that he held their theological views, and accordingly we find in a MS. of the 8th century a letter of his to the emperor Leo regarding Theodore of Cyrillus, who had come to him and tried to pervert him to the opinions of the Dyophysites,¹⁰ and in another MS., of about the same age, three letters to the emperor Leo, to the abbot Jacob of Kaphrā Relmā, and to John I., patriarch of Antioch, all tending to prove that he rejected the council of Chalcedon.¹¹ A third MS., of the 6th century, contains certain "precepts and admonitions" addressed by him to the brethren.¹² There is extant in very old MSS. a *Life* of Simeon, full of absurd stories, which has been edited by S. E. Assemani in the *Acta Sanctorum Martyrum*, vol. II. 268 sq. At the end of it (p. 394) there is a letter by one Cosmas,¹³ priest of the village of Panir, written in the name of his congregation to the Stylite, promising implicit obedience to all his precepts and orders, and requesting his prayers on their behalf, but there is nothing whatever to show that this Cosmas was the author of the *Life* or had any share in writing it.¹⁴

Dādā ishō. About this time we find Dādā ishō, the catholicus of Seleucia (421-456),¹⁵ composing his commentaries on the books of Daniel, Kings, and Bar Saumā or Ecclesiastica.¹⁶ But the chief seat of Nestorian scholarship and literary activity was still the Persian school of Edessa, where Bar Saumā and other teachers were actively engaged in defending and propagating their peculiar tenets. Bar Saumā, if we may believe the scurrilous Monophysite Simeon of Bēth Arshām, was originally the slave of one Mārā of Bēth Kardu, and bore at Edessa the nickname of *Sālu bēth kēnāyā*.¹⁷ He was at Edessa in 449, when his expulsion was called for by the rabble.¹⁸ In what year it actually took place we do not know, but we afterwards find him busy in the East under the catholicus Bābhōyah or Babuans (from about 457 to 483)¹⁹ and his successor Acacius (from about 484 to 496), during which period he was bishop of Nisibis.²⁰ Of his personal character and work this is not the place to attempt to form a judgment, but the reader should beware of placing implicit trust in the statements of bitter and unscrupulous theological opponents like Simeon of Bēth Arshām, Bar Hebraeus, and Assemani. Bar Saumā does not appear to have written much, as 'Abhd ishō²¹ mentions only parabolic and funeral sermons, hymns of the class called *turgamā*,²² metrical homilies (*madhrāshē*), letters, and an anaphora or liturgy.

Narsai. A fellow-worker with him both at Edessa and Nisibis was Narsai (or Narse), of Ma alle thā or Ma althāyā,²³ whom Simeon of Bēth Arshām calls "the Leper,"²⁴ whereas his co-sectarians style him "the Harp of the Holy Spirit." He was especially famous as a writer of hymns and other metrical compositions, his favourite metre being that of six syllables.²⁵ He fled from Edessa to escape the wrath of the bishop Cyrus (471-498), probably in the year 489, and died

at Nisibis early in the next century.²⁶ Narsai's works, as enumerated by 'Abhd-ishō,²⁷ consist of commentaries on the first four books of the Pentateuch, Joshua, Judges, and Ecclesiastes, Isaiah and the twelve minor prophets, Jeremiah, Ezekiel, and Daniel, twelve volumes of metrical discourses (360 in number),²⁸ a liturgy, expositions of the order of celebrating the Eucharist and of baptism, parabolic and funeral sermons, hymns of several sorts,²⁹ and a book entitled *On the Corruption of Monks*.

Mārī the Persian has been already mentioned as the correspondent Mārī the of Ibas. Besides the commentary on the epistles of Acacius (see Persian above, p. 829), he wrote a commentary on the book of Daniel and a controversial treatise against the magi³⁰ of Nisibis.³¹ Acacius, catholicus of Seleucia (c. 484-496), composed discourses on fasting and on of Selene the faith, as also against the Monophysites, and translated into Persian for the king Kawādī a treatise on the faith by Ishia, bishop of Nisibis, the successor of Bar Saumā.³² Assemani tries hard to cleanse Acacius from the stain of Nestorianism, but, as Abbeles remarks,³³ "creor ne Ethiopean dealbare soluerit, nam omniuntum Jacobitarum tum Nestorianorum monumenta, qui ipse recitat, contrarium testantur." Mikhā or Mikhā, another member of the Vihā band of exiled Edessenes,³⁴ became bishop of Lāhōm.³⁵ He wrote a commentary on the books of Kings, a discourse on his predecessor Sabhr ishō, another on a person whose name is written Kautropos,³⁶ and a tract entitled *The Five Reasons of the Maudibh*.³⁷ To these writers may be added two others, — Yazādādh,³⁸ who is also said to have belonged to the Edessene school and to have compiled "a book of collectanea (*ḏulḏā*),"³⁹ and Arī, who wrote a treatise against the magi or Persian priesthood, and another against the followers of Bardesanes with the contemptuous title of *Ḥabshash yāthā* or "the Beetles."⁴⁰

The Persian school at Edessa was, as we have already hinted, truly the chief seat of the study of Greek during the early days of the later Syrian literature. Of the most ancient translators we know no from thing, but the oldest MSS. are Edessene, viz., the famous MS. in the British Museum, Add. 12150, dated towards the end of 411, and the equally well known codex at St Petersburg, written in 462. The former contains the *Recognitions* of Clement, the discourses of Titus of Bostra against the Manichees, the *Theophania* of Eusebius, and his history of the confessors in Palestine, the latter, the *Ecclesiastical History* of Eusebius. Now, as the text presented by these MSS. has evidently passed through the hands of several successive scribes, it seems to follow that these books were translated into Syriac in the lifetime of the authors themselves, or very soon after, for Eusebius died in 340 and Titus in 371. Very likely the one or the other may have had a friend at the chief seat of Syriac learning who was willing to perform for him the same kind of office that Rabbāli undertook for Cyril.⁴¹ A little later on our information becomes fuller and more exact. Ma'nā,⁴² a Persian by race,⁴³ from the town of Bēth Hardashir, was resident at Edessa in the earlier part of the 5th century, and is mentioned by Simeon of Bēth Arshām among the distinguished Nestorian scholars whom he holds up to ridicule.⁴⁴ His nickname was *Shāthē kēnā*, "the Drinker of Ashes."⁴⁵ Mārī devoted himself to the task of translating into Syriac the commentaries of Theodore of Mopsuestia during the lifetime of that great theologian, who did not die till 429. He must, however, have withdrawn from Edessa at a comparatively early period, as he was bishop of Persis⁴⁶ prior to 420, in which year (the last of his reign) Yazadgerd I. made him catholicus of Seleucia, in succession to Labī alāhā.⁴⁷ He had, it appears, translated a number of books from Syriac into

³⁹ Of Arā we seem to know absolutely nothing. His very Jewish is uncertain, and he may have belonged to the previous century, R.O., III. 1. 230.
⁴⁰ See above, p. 829, and compare Merx "De Eusebiana Historia Eccles. Ver Orientalis" Florence, 1880, I. 190 sq., especially pp. 201-202. It may here be mentioned that the literature of Armenia is largely indebted in its earliest days for such works as the *Doctrine of Addai* and the *Homilies of Aphraates*, wrongly ascribed to Jacob of Nisibis.
⁴¹ So the name is written by Mārī bar Shēlāmōn, whom Assemani follows R.O., III. 1. 378, pronouncing it, however, Ma'nē or Manne. Elias of Nisibis himself (see. cit.) has Maghā, which Abbeles Latinizes Magaca.
⁴² His Persian name is unknown to us. ⁴³ R.O., I. 352. ⁴⁴ Bar Hebraeus, Chron. Eccles., II. 55, 63. ⁴⁵ R.O., II. 401.

Persian (Pahlavi), and thus probably ingratiated himself with the king.¹ However, he soon fell under the royal displeasure, was degraded from his office, and ordered to retire to Persia, where he resumed his former duties,² and so incurred the anger of Yazdegerd's successor, Pīōz.³ Ma'nā's work, the exact extent of which is not known to us, was carried on and completed by other members of the Persian school,—such as Aerius the catholicus and Yazīdādī, John of Bēth Garmai, afterwards bishop of Bēth Sūr (or Sūrī?), and Abraham the Mede, disciples of Narsai, Mikhā, afterwards bishop of Lāshōm in Bēth Garmai, Paul bar Kakai (or Kaki), afterwards bishop of Līdhūn in al Ahwīz, 'Abhshotā (?) of Nineveh, and others,⁴—who are expressly said to have "taken away with them" (*appēl 'ammēhōn*) from Edessa, and disseminated throughout the East, the writings of Theodore and Nestorius.⁵ Ibrs himself was one of these translators in his younger days (see above, p. 829). About the same time with Ma'nā's translations began the Aristotelian studies of the Syrian Nestorians. To understand and translate the writings of their favourite Greek theologians, Paul of Samosata, Diodore of Tarsus, Theodora of Mopsuestia, and Nestorius himself, not to mention Theodoret⁶ of Cyrrhus, required a considerable knowledge of the Aristotelian logic. Hence the labours of

Probus

Monophysite schism

Bar-samū, the archimandrite

Jacob of Serūgh

Probus (Πρόβος, in Syriac *Prōbhos*, *Prōbhā*, or *Prōbhī*), who translated and commented on the *Περί ἐρμηνείας*,⁷ and probably treated in a similar manner other parts of the *Organon*.⁸ It is not easy to fix his date precisely. 'Abhd ishō⁹ makes him contemporary with Ibrs and another translator named Kūmī. If the Berlin MS Sachau 226 can be trusted, he was archidiacon and archiater at Antioch. Hoffmann¹⁰ has assigned reasons for supposing him not to be anterior to the Athenian expositor Syrrinus (433-450). Whilst the Nestorians were thus making rapid progress all over the East, another heresy was spreading in the West. Eutyches had found followers in Syria, among others Bar-samū the archimandrite, a man famous for his piety and asceticism,¹¹ who represented the abbots of Syria at the second council of Ephesus,¹² and was afterwards condemned by the council of Chalcedon.¹³ He died in 458.¹⁴ His life was written by his disciple Samuel, in much the same style as that of Simeon Stylites, and is extant in several MSS in the British Museum.¹⁵ His memory has always been held in the greatest reverence by the Jacobites. The Armenians, according to Assemanus,¹⁶ keep his commemoration on the 1st of February, the Syrians and Copts on the 3d. The decisions of the council of Chalcedon produced an immediate and irreparable breach in the Eastern Church, and the struggle of the rival factions was carried on with desperate fury alike at Constantinople, Antioch, and Alexandria. In Syria the persecution of the Monophysites was violent during the years 518-521, under the emperor Justin, and again in 535 and the following years, under Justinian, when they seemed in a fair way of being completely crushed by brute force.

The first name to be mentioned here, as belonging to both the 5th and 6th centuries, is that of Jacob of Serūgh, one of the most celebrated writers of the Syrian Church.¹⁷ "The flute of the Holy Spirit and the harp of the believing church." There are no less than three biographies of him extant in Syriac,—the first, by his namesake Jacob of Edessa,¹⁸ the second, anonymous,¹⁹ the third, a lengthy metrical panegyric, said to have been written for his commemoration²⁰ by a disciple of his named George.²¹ Thus, however, seems, from the whole tone of the composition, to be unlikely, and Bickell is probably right in supposing the author to be George,

bishop of Serūgh, a contemporary of Jacob of Edessa.²² Jacob was born at Kirtam, "a village on the river Euphrates," probably in the district of Serūgh, in 451. His father was a priest, and, as his parents had been childless for many years, his birth was regarded as a reward for their alms, prayers, and vows. Whether he was educated at Edessa or not, he soon acquired a great reputation for learning and eloquence. He appears to have led a life of quiet work and study, and to have devoted himself in particular to literary composition. He became peripatetic of Harrān in Serūgh, whence we find him writing to the Christians of Nāyrīn, and to the city of Edessa when threatened by the Persians.²³ As peripatetic he is mentioned in eulogistic terms by Joshua the Stylite²⁴ (503). In 519, when sixty-eight years old, he was made bishop of Batnān, the chief town of Serūgh, where he died on 29th November 521. Jacob's prose writings are not numerous.²⁵ A liturgy is ascribed to him, and an order of baptism, the former of which has been translated by Renandot,²⁶ the latter edited by J. A. Assemanus.²⁷ Further, he composed six festal homilies, one of which has been published by Zingerle,²⁸ who has also translated the whole of them into German.²⁹ a discourse showing that we should not neglect or despise our sins³⁰, another for the night of Wednesday in the third week of Lent³¹, and some short funeral sermons.³² To him we also owe a life of Mār Hannūnā (died in 500), addressed to one Philotheus.³³ Of his letters a considerable number have been preserved, particularly in two MSS in the British Museum, Add. 14587 and 17163, ff. 148.³⁴ Of these Martin has edited and translated the three epistles to the monks of the convent of Mār Bassus at Harrān,³⁵ with a reply by the monks, and another letter to Paul, bishop of Edessa, from all of which it is evident that Jacob always was a Monophysite, and continued such to his death.³⁶ The letter to Stephen bar Sūdān is given, with an English version, by Frothingham,³⁷ and that to the Hunyāritō Christians of Nāyrīn has been edited and translated by Schroter in the *Z D V G*, xxx. (1877), p. 360 sq. It belongs to the year 519 or 520.³⁸ According to Bar Hebraeus,³⁹ he also wrote "a commentary on the six centuries of Diognisus, at the request of Mār George, bishop of the (Arab) tribes, who was his disciple." As George, bishop of the Arab tribes, was a contemporary of Jacob of Edessa, this statement seems to rest on some unsatisfactory ground, at all events no such work now exists. The paucity of Jacob's prose writings is more than compensated by a flood of metrical compositions, mostly in dodecasyllabic verse, or the four syllable line thrice repeated. "He had," says Bar Hebraeus,⁴⁰ "seventy amannuses to copy out his metrical homilies, which were 760⁴¹ in number, besides commentaries and letters and odes (*madrāshē*) and hymns (*shuhyathū*)."⁴² Of these homilies more than the half have perished, but nearly 300 are still preserved in European collections.⁴³ Very few of them have as yet been published, though many of them are by no means devoid of interest.⁴⁴ Indeed Jacob is on the whole far more readable than Ephraim or Isaac of Antioch.

Very different from the gentle and studious bishop of Serūgh Philo was his contemporary and neighbour, the energetic and fiery Philoxenus of Aenus of Mabbōgh. Aksenūyā or Philoxenus was a native of Tahrī Nab sonowhere in Bēth Garmai, and studied at Edessa in the time of Ibrs.⁴⁵ He was ordained bishop of Hierapolis or Vablagh (Vablagh) by Peter the Fuller, patriarch of Antioch, in 484, and devoted his

¹ Ibid., iii. 1, 376. ² Bar Hebraeus, *Chron. Eccles.*, ii. 63. ³ B.O., ii. 402, iii. 1, 377. ⁴ Ibid., i. 341-344. ⁵ B.O., i. 450, iii. 1, 226, note 8. ⁶ His *ΕΡΜΗΝΕΙΣ* (of which the fourth book is a demonstration per syllogismos of the incarnation) appears as the name of an author in 'Abhd ishō's *Catalogue* (B.O. iii. 1, 41), under the form of Eranistatheos or something similar. ⁷ See Hoffmann, *De Hermeticae apud Syros Aristoteleis*, 1860, VSS.,—Berlin, Alt. Best. No. 9, 10. Brit. Mus. Add. 14660. The translation may possibly be even anterior to Probus. ⁸ Berlin, Sachau 226, 1 is described as "Isagoge des Porphyrius, von Probus, Presbyter, Archidiacon und Archiater in Antiochien" and in the same MS., No. 8, is "Erklärung der Analytica von Probus" with an "Einleitung in d. Erl. d. Anal. von Probus," No. 7. ⁹ B.O., iii. 1, 82. ¹⁰ Op. cit., pp. 144-145. The name of Fubri or Philurius, which appears as a variation of Probus in Hottinger (B.O.), in Assemanus (B.O., iii. 1, 85, note 5) in Renan (*De Philosophia Peripatetica apud Syros*, p. 14) and in other books on this subject has nothing to do with that of Probus, but is an error for Kūwārī 'Abd Isākh Ibrāhīm, a Syro-Arabian Aristotelian who lived about the beginning of the 10th century. Some of Jacob's homilies are extant in Arabic, and even in Ethiopic. His prayer as a child see in Overbeck, op. cit., p. 382. ⁴⁹ B.O., i. 343.

John bar
Cursus

To the same age and sect as Simon. He is called John bar Cursus (Κούρος),¹ bishop of Tellā or Constantina. He was a native of Callinicus (al-Rikkah), of good family and was carefully educated by his widowed mother, who put him into the army at the age of twenty. He would not, however, be hindered from quitting the service after a few years and becoming a monk. Subsequently, in 519, he was raised to the dignity of bishop of Tellā, whence he was expelled by Justin in 521. In 533 he visited Constantinople, and on his return to the East was seized by his enemies in the mountains of Singir, and dragged to Nisibis, Rās'ain, and Antioch, where he died in 538, at the age of fifty-five, having been for a year and six days a close prisoner in the convent of the Comes Marcellus by order of the cruel persecutor Ephraim, patriarch of Antioch (520-514).

He was written by his disciple Elias (of Dārī) ² The Jacobite commemorates him on the 6th of February. Canon by John of Tellā are extant in several MSS in the British Museum and elsewhere ³ The questions put to him by Sergius with his replies have been published by Lamy ⁴ His creed or confession of faith, addressed to the convents in and around Tellā, is found in Brit Mus Add 14749 (*Catal*, p. 431), and an exposition of the Trisagion in Cod Vat. elia (*Catal*, in 314) and Bodl Marsh 101 (Payne Smith, *Catal*, p. 463, No. 20).

Mār III
of Amid

Another of the unfortunate Monophysite bishops whom Justin expelled from their sees (in 519) was Mār III of Amid, the third bishop of the name. He was banished, with his synchell and with Isidore, bishop of Ken meshim (Kumeshim), in the first instance to Petra, but was afterwards allowed to go to Alexandria, ⁵ where he died in about eight years ⁶ According to Assemani (*Bibl Orient*, ii 52, comp. p. 160), he wrote a commentary on the Gospels. It would seem, however, from a passage of Zacharias Rhetor, ⁷ that Mār III merely prefixed a short prologue in Greek to a copy of the Gospels which he had procured at Alexandria, ⁸ and that this MS contained (as might be expected) the pericope on the woman taken in adultery (John vii 2-11). That the Syriac translations of the prologue and pericope were made by himself is nowhere stated.

John bar
Aphthōnā

Yet another sufferer at the hands of Justin was John bar Aphthōnā (Aphthōnā, his mother's name) ⁹ He was abbot of the convent of St Thomas at Selencia (apparently in Phoenicia), which was famous as a school for the study of Greek literature. Being expelled thence, he removed with his whole brotherhood to Ken meshim (the Eagles' Nest) on the Euphrates, opposite Enropus (Jeribis), where he founded a new convent and school that more than rivalled the parent establishment, for here Thomas of Haracler, Jacob of Edessa, and others received their training in Greek letters ¹⁰ His *Life*, written by a disciple, is extant in Brit Mus Add 12171 ¹¹ According to Dionysius of Tell Mahrē, as quoted by Assemani (*loc cit*), he died in 538. He wrote a commentary on the Song of Songs, some extracts from which are preserved in a *Calena Patrum* in the British Museum (Add 12168, f. 138a), a considerable number of hymns, ¹² and a biography of Severus of Antioch, ¹³ which must have been his last work, as he survived Severus only about nine months.

Jacob
Burdā-
'inī

We now come to the man who was the real founder of the Jacobite Church in Asia, and from whom the Jacobites took their name, Jacob bar Theophilus surnamed "Burdā'ini," ¹⁴ because his dress consisted of a *burda'thā* or coarse horse cloth, which he never changed till it became quite ragged ¹⁵ What Assemani could learn regarding him he has put together in the *Bibl Orient*, ii 62-69 ¹⁶ since then our sources of information have been largely increased, especially by the publication of the *Ecclesiastical History* of John of Ephesus by Burton and of the same writer's *Lives in Land's Ancient Syr*, ii 17. On a careful study of these is based Klein's excellent book *Jacobus Barada'ni, der Stichter der Syrischen Monophysitischen Kirche*, 1882. Jacob was the son of Theophilus bar Mār'ū, a priest of Tellā or Constantina, and the child of his old age. After receiving a good education, he was entered at the monastery of Pēlītī (or the Quarry), ¹⁷ close by the village of Gum mūthā in Mount Izalā (or Izlā), ¹⁸ not far from Tellā. About 527

of the *Annales* Borjano and in Brit Mus Add 14650, from which it has been re-edited (with an excellent introduction, translation, and notes) by Guidi, *La Lettera di Simeone, Sc. Reale Accademia dei Lincei* 1881. To this work the reader is referred for all the documents bearing on the subject.

¹ The name of the father is also given as Cursus and Cyriacus. Assemani's *Bibl Orient*, ii 54, is misleading.

² There are two copies in the British Museum, edited by Klein, *Hel. Zeyen* *Johnannes van Tellā door Elias*, 1882, see also the *Life* by John of Asia in *Land's Ancient Syr*, ii 100.

528 he and another monk of Tellā, named Sergius, were sent to Constantinople in defence of their faith, and, being favourably received by the empress Theodora, they remained there fifteen years. Meantime the persecutions of the Monophysites, more especially that of 536-537 by Ephraim of Antioch, seemed to have crushed their party, despite all the efforts of the devoted John of Tellā and John of Hephastus ¹⁹ This state of matters excited the religious zeal of al-Hārith ibn Jabalah, the Arab king of Ghassini, who came to Constantinople in 542-543, and urged Theodora to send two or three bishops to Syria. Accordingly two were consecrated by Theodosius, the exiled patriarch of Alexandria, namely, Theodore as bishop of Bostra, with jurisdiction over the provinces of Palestine and Arabia, and Jacob as bishop of Edessa, with jurisdiction over all Syria and Asia. From this time forward Jacob's life was one of ceaseless toil and hardship. He visited in person and on foot almost every part of his vast diocese, consecrating deacons and priests, strengthening the weak, and bringing back those who had erred from the true faith. But to restore the Monophysite Church bishops were necessary, and the consecration of a bishop required the presence of at least three others. Selecting a priest named Conon from Cilicia and another named Engimus from Isauria, he travelled with them to Constantinople and thence to Alexandria with letters of recommendation from the patriarch Theodosius. At Alexandria Conon was ordained bishop of Tarsus in Cilicia and Engimus bishop of Solencia in Isauria, whilst Antoninus and Antonius were consecrated for dioceses in Syria. On his return to Syria other bishops were appointed to sees there and in Asia, among the latter the historian John of Ephesus, and so the work progressed, till at last Jacob's efforts were crowned by the enthroning of his old friend Sergius as patriarch of Antioch (in 544). Sergius died in 547, and the see remained vacant for three years, after which, by the advice of Theodosius, Jacob and his bishops chose Paul, an abbot of Alexandria, to be their patriarch. Of the subsequent internal strife among the Monophysites themselves we cannot here speak. The aged Jacob set out once more in the year 578 to visit Damian, patriarch of Alexandria, but died on the Egyptian frontier in the convent of Mār Romanus or of Casion. Here his remains rested in peace till 622, when they were stolen by the emissaries of Zacharias, bishop of Tellā, and buried with much pomp in the monastery of Pēlītī ²⁰ His commemoration takes place on 28th November, 21st March, and 31st July. Jacob's life was too active and busy to admit of his writing much. We may mention an anaphora, ²¹ sundry letters, ²² a creed or confession of faith, preserved in Arabic and a secondary Ethiopic translation, ²³ and a homily for the feast of the annunciation, also extant only in an Arabic translation ²⁴.

Conspicuous among the scholars of this age for his knowledge of Greek, and more especially of the Aristotelian philosophy, was of Sergius, priest and archdeacon of Rās'ain. He was, however, if Rās'ain Zacharias Rhetor may be trusted, a man of loose morals and a vicious ²⁵ He journeyed in 535 from Rās'ain to Antioch to lodge a complaint before the patriarch Ephraim against his bishop Asylus ²⁶ Just at this time the exiled Severus of Antioch and Theodosius of Alexandria, as well as the Stylite monk Ycōrī were living with Anthimus of Constantinople under the protection of the empress Theodora. Thus armed Ephraim, who seems to have found a willing tool in Sergius. At any rate he sent him to Rome with letters to Agapetus, who travelled with him to Constantinople in the spring of 536, and procured the deposition and banishment of the Monophysites. Sergius died at Constantinople almost immediately afterwards, and Agapetus followed him in a few days, wherein John of Ephesus and Zacharias Rhetor clearly see the judgment of Heaven ²⁷ As a man of letters, Sergius was to the Monophysites what Probus was to the Nestorians: he was the first ²⁸ to make them acquainted with the works of Aristotle by means of translations and commentaries. 'Abid Ishō, it is true, gives Sergius a place in his catalogue of Nestorian writers, ²⁹ and states that he composed "expositions of logic or 'dialectics', but he merely does so in the same way and on the same grounds that he registers the name of Jacob of Edessa as the author of "annals and a chronicle" ³⁰ The books were too valuable for him to insist on the heresy of the writer. In the case of Sergius, there was an additional reason. The man was well known in the East, ³¹ many of his works being dedicated to his friend and

¹⁹ *Ibid*, p. 170.

pupil Theodore, afterwards Nestorian bishop of Murr or Merv (see p. 837 *infra*).¹ What remains of Sergius's labours is mostly contained in a single MS of the 7th century (Brit. Mus. Add. 14658).² Of translations from the Greek we find in this volume the *Isagoge* of Porphyry, followed by the so-called *Tabula Porphyryi*,³ the *Categories* of Aristotle,⁴ the *Ἐπεὶ κἀποὶν πρὸς Ἀλέξανδρον*,⁵ and a treatise on the soul,—not the well known *Ἐπεὶ ψυχῆς*, but a wholly different tractate in five short sections. It also contains Sergius's own treatise on logic, addressed to Theodore, which is unfortunately imperfect, a tract on negation and affirmation, a treatise, likewise addressed to Theodore, *On the Causes of the Universe, according to the views of Aristotle, showing how it is a circle*, a tract *On Genus, Species, and Individuality*, and a third tract addressed to Theodore, *On the Action and Influence of the Moon*, explanatory and illustrative of Calen's *Ἐπεὶ κἀποὶν ἡμερῶν*, bk. iii.,⁶ with a short appendix "On the Motion of the Sun". Here too we find part (sections 11, 12) of his version of the *Ars Grammatica* of Dionysius Thrax, a larger portion (sections 11-20) being contained in Brit. Mus. Add. 14620 (Wright, *Catal.*, p. 802). There is a scholion of Sergius on the term *σχήμα* in Brit. Mus. Add. 14660 (see Wright, *Catal.*, p. 1162). In his capacity of physician, Sergius translated part of the works of Galen (Brit. Mus. Add. 14661 contains books vi. viii of the treatise *De Simplicium Medicamentorum Temperamentis ac Facultatibus* (Wright, *Catal.*, p. 1167),⁷ addressed to Theodore, and in Brit. Mus. Add. 17176 there are three leaves, two of which contain fragments of the *Ars Medica*, and one of the treatise *De Alimentorum Facultatibus* (Wright, *Catal.*, p. 1188).⁸ As one of the clergy, he wasted his time in making a translation of the works which passed under the name of Dionysius the Areopagite.⁹ Brit. Mus. Add. 12151¹⁰ contains this version with the introduction and notes of Phocas bar Sergius of Edessa,¹¹ a writer of the 8th century, as appears from his citing Athanasius II and Jacob of Edessa. In Brit. Mus. Add. 22370¹² we find Sergius's own introduction and the commentary of a later writer, Theodore bar Zarūdi.¹³

If Sergius was the Probus of the Monophysites, their M'nū was Paul, bishop of Callinicus (ar Rakkah),¹⁴ who, being expelled from his see in 519, betook himself to Edessa and there devoted himself to the task of translating the works of Severus into Syriac. We know for certain¹⁵ that he edited versions of the correspondence of Severus and Julian of Halcarnassus on the corruptibility or incorruptibility of the body of Christ, with a discourse of Severus against Julian¹⁶, of the treatise against the *Additions or Appendices* of Julian,¹⁷ and against the last apology of Julian¹⁸, of that against

residing at the Persian court, where he translated into Greek a history of the Kings of Persia (see B.O. III. 1, 67, note 3, Renan, *De l'histoire de l'Église en Perse*, t. II, p. 242).

¹ Wright, *Catal.*, p. 1161 sq. comp. Renan, *op. cit.*, p. 23 sq. *Journ. asiat.*, 1852, 4th series, vol. xix, p. 319 sq.

² There is a fragment of the *Isagoge* also in Brit. Mus. Add. 1618 (Wright, *Catal.*, p. 735).

³ In the Vatican MS. clviii (Catal. III. 306, No. vi.) this translation is wrongly ascribed to Jacob of Edessa, who could hardly have been more than a boy at the time when the MS. in the British Museum was transcribed. Besides the version is not in his style. The Paris MS. Ancien fonds 161 naturally repeats this mistake (Zotenberg, *Catal.*, p. 202). In *Catal. Bibl. Palat. Medic. cod. exviii.*, it is likewise erroneously attributed to Honsin Ibn Ishak (comp. Renan, *De Philos. Peripat. ap. Syros*, p. 24 note 3). The Berlin MS. Alt. Best. 36 contains as No. 7 a treatise of Sergius on the *Categories* addressed to Philothena.

⁴ Edited by Lagarde, *Anal. Syr.*, p. 184 sq.; see V. Ryssel, *Ueber den Text kritischen Werth d. Syr. Uebersetzungen griechischer Klassiker* part I. 1850, part II. 1851. In part I. p. 4 Professor Ryssel speaks of this version as "ein Meisterwerk der Uebersetzungskunst", and in part II. p. 10 he says "Die Uebersetzung der Schrift *Ἐπεὶ κἀποὶν* schliesst sich aufs engste an den Text des griechischen Originals an. Dass wir deshalb diese Uebersetzung als eine im besten Sinne wortgetreue bezeichnen können, zeigt schon eine Vergleichung mit der lateinischen Bearbeitung des Apulejus von Madama. This opinion serves to rectify the judgement of Ibn Abi Osaibah (l. 204) that Sergius was only a mediocre translator, and that his work needed revision by the later Honsin Ibn Ishak.

⁵ See Sachau, *Inedita Syr.*, pp. 101-120.

⁶ This identification is due to Merx (see *Dionysii Thracis Ars Grammatica* ed. Uhlig, p. xlii sq. Merx has treated of an old, but independent, Armenian version in the same book, p. lvi sq.).

⁷ See Merx's article in *Z. D. M. G.* xxxix (1885), p. 237 sq.

⁸ See Sachau, *Inedita Syr.*, pp. 88-94.

⁹ See Frothingham, *Stephen bar Sudall*, p. 3.

¹⁰ B.O. I. 468. Assemani erroneously places him before Jacob of Edessa.

¹¹ See Wright, *Catal.*, p. 500.

¹² There are also old MSS. of Sergius's version in the Vatican, *Catal.*, III. Nos. cvii. (p. 56) col. v (p. 542). Bar Hebraeus states (*Hist. Dynast.*, p. 158 transl. p. 99) that Sergius translated into Syriac the *Synagoga* of the Alexandrian priest and physician Aaron and added to it two books. But Steinschneider (*Al Farabi* p. 169 note 2) says that this is a mistake, and that the real author of the two additional books was the Arabic translator Mūsā Jawālī or Mūsā Jāzī. The translator of the *Geoponica*, *Al Fihārī* or Rūmīyāh (Leyden cod. 414 Warr. *Catal.*, III. 211) and joint translator of the *Μεγίστη συνταξις* of Ptolemy (Leyden cod. 680 Warr. *Catal.*, III. 80) by name Serjis or Serjūn (Sergius or Seron) son ar Rūmī, seems to be a quite different person of later date.

¹³ B.O. II. 46. He is to be distinguished from his namesake and contemporary, Paul, bishop of Edessa, who was banished to Enchabta in 522 (B.O. I. 409-411), restored to his see in 526 (*ibid.* p. 418) and died in the following year, whereas Paul of Callinicus was working at Edessa in 528 (see p. 838 *infra*).

¹⁴ Thanks in part to a note at the end of Cod. Vat. cxi. (*Catal.*, III. 223, comp. B.O. I. cii.).

¹⁵ Completed in 528, Cod. Vat. cxi., Brit. Mus. Add. 17200 (Wright, *Catal.*, p. 554).

¹⁶ Cod. Vat. cxi. Brit. Mus. Add. 12158 (Wright, *Catal.*, p. 556), dated 538.

¹⁷ Brit. Mus. Add. 12158.

the Manichees, and of the *Phalaleth*.¹⁹ Prokold by him are the older translation of the *Homiliar Cathedrales*²⁰ and that of the correspondence of Sergius Grammaticus and Severus regarding the doctrine of the two natures in Christ.²¹ Possibly, too, the translation of the treatise against John Grammaticus of C... and of some other works which are known to us only by a few scattered citations.²² Hence he is called by the Syriac writers *Ἐπεὶ κἀποὶν* and *Ἐπεὶ κἀποὶν*, "the Translator of P...".

Thus seems the proper place to make mention of a most important (and though anonymous) work, the translation of the so-called *Civil Laws of Laws of the Emperors Constantine, Theodosius and Leo*, which lies at the root of all subsequent Christian Oriental legislation in ecclesiastical, judicial, and private matters.²³ The Syriac version, made from a Greek original, exists in two main copies, the older of which undeniably belongs to the earlier part of the 6th century. The work itself appears, according to the researches of Lamm (op. cit. pp. 318-319), to date from the time of the emperor Justinian (Brit. Mus. Add. 475-477), who was a favourer of the Monophysites, the Syriac translation is ascribed to a Monophysite monk of Antioch or Hierapolis (*ibid.*, p. 155). The Paris MS. probably represents a Nestorian revision of the 9th or 10th century at Antioch (*ibid.*, p. 166). The oldest MS. of the secondary Arabic version is dated 1372 (*ibid.*, p. 161), but it has been traced back to the time of the Nestorian lawyer Abu Hāriri Aballāh ibn al-Tamīm (who died 1013), whether made by him or not (*ibid.*, p. 177). It belongs to the same class as the London Syriac but is based on a better text, such as that of the fragment in Brit. Mus. Add. 18287 (*ibid.*, p. 172).²⁴ Of the secondary Armenian translation the same is to be said as of the Arabic. The oldest MS. of it dates from 1328, but it probably goes as far back as the end of the 12th century (*ibid.*, p. 161). The Georgian version, of which there is a MS. at St. Petersburg, is most likely an offshoot of the Armenian.

Another scholar, besides Sergius, whom Abū Ishāq wrongly claims to be a Nestorian is Abū Ishāq al-Ḥimārī, metropolitan of Irbil (Irbil) diocese. He appears, on the contrary, to have been the head of the Monophysites in the Persian territory. According to Bar Hebraeus,²⁵ he was appointed by Christopher, catholicos of the Armenians to be bishop of Beth 'Arshān²⁶ but was promoted by John Burdennan in 559 to the see of Taghrith, where he ordained many priests and founded two monasteries. Among his numerous converts from heathenism was a youthful member of the royal family of Persia whom he baptized by the name of George. This caused the anger of Khosrō II Anūshirvān, who ordered the bishop to be beheaded (2d August 577). As a writer Abū Ishāq's name seems to have been more of a philosopher than a theologian.²⁷ He wrote against the Persian priesthood and against the (1) philosopher, a book of definitions, a treatise on logic, on freewill in two discourses, on the soul and on man as the microcosm, and a treatise on the composition of man as consisting of soul and body.²⁸ He is also mentioned by later authors as a writer on grammar.

Somewhat before this time a monk of Edessa, whose name is now known to us, tried his hand at the composition of a tripartite historical romance.²⁹—a history of Constantine and his three sons, an historical account of Iulianus, bishop of Rome, and his sufferings at the hands of Julian the Apostate, and a history of Jovian or, as the Orientals usually call him, Jovianus, under Julian and during his own reign. The whole purports to be written by one Apollon or Apollonius (Apollonius?), an official at the court of Jovian, at the request of 'Abdīl, abbot of Sndrūn (?) Nihūzā, with a view to the conversion of the heathens. All three parts contain but a very small quantity of historical facts or dates, and deal in the gross exaggerations and inventions. Yet the Syriac style is pure, and we gain from the book a good idea of the way in which the author's countrymen thought and spoke and acted. This romance has been published by Hoffmann,³⁰ and Noldeke has given a full account of it, with an abridged translation, in *D. M. G.*, xxviii. p. 263 sq. He places the time of composition between 502 and 532. It is curious to find that this romance must have been known in an Arabic translation to the

¹⁹ There is a long extract from this work in Cod. Vat. cxi. (*Catal.*, III. 223).

³¹ *Julianus der Abtrünnige*, 1880.

historian at Tabari, who treats it as a genuine historical document.¹ From him it has passed to the *Kāmil* of Ibn al Athir, i 233 sq., and the *Al-Habār al-Bashar* of Abu 'l Fida' (*Hist. Islamica*, ed. Leisler, p. 84). Ibn Wadh al-Ya'kubi seems in his *Annals* to have drawn from the same source, though independently of al Tabari, and so also al Mas'ūdi, *Murāj adh-Dhahab*, ii 328. Bar Hebraeus has also made some use of it in his *Chronicon*, ed. Bruns and Kirch, pp. 68-69. No doubt, too, it is the work attributed by 'Abd al-shā' to the grave ecclesiastical historian Soerates, who, as he wrote, "a history of the emperors Constantine and Justinian."

Another, but much inferior, romance, of which Julian is the hero, is contained in Brit Mus Add 7192, a manuscript of the 7th century. It has been edited by Hoffmann, *op. cit.*, pp. 242-259, and translated by Noldke, *Z D V G*, xxviii 660-674. We shall not be far wrong in assigning it likewise to the 6th century, though it is probably rather later than that just noticed.

Of real historical value, on the contrary, is the anonymous *Chronicon Fidei*, fortunately preserved to us in the Vatican MS. clxxxv, and edited by Assemani in *B O*, i 383-417. There is an English translation of it in the *Tanin of David*, 1864, vol. i (pp. 1-107), p. 25 sq. It begins with A Gr 180, but the entries are very sparse till we reach A Gr 513 (202 A D). The last of them refers to the year 510, about which time the little book must have been compiled. The author made use of the archives of Edessa and other documents now lost to us, as well as of the *Chronicle* of Isidore the Stylite (see above, p. 832). In religious matters he is not a violent partisan, nor given to the use of harsh words, a thing to be noted in the age in which he lived.

Another writer of first rate importance as a historian is John, bishop of Asir or Ephesus, "the teacher of the heathen," "the over-seer of the heathen," and "the idol breaker," as he loves to style himself. He was a native of Amid, and must have been born early in the 6th century, according to Land about 505. He was ordained deacon in the convent of St John in 529, when he must have been at least twenty years of age. In 531 the terrible pestilence of the reign of Justinian broke out, and at that time John was in Palestine, "having doubtless fled from Amid to avoid the persecution of the Monophysites by Abraham bar Kih' (?) of Tellā, bishop of Amid (from about 520 to 516), and Iphraim bar Appan of Amid, patriarch of Antioch (520-544), "a much worse persecutor than Paul or Euphrasius." In 535 we find him at Constantinople, where in the following year, according to Bar Hebraeus, he became bishop of the Monophysites in succession to the deposed Anthimus. Be this as it may, he was certainly received with great favour by Justinian, whose friendship and confidence he enjoyed for thirty years, and "had the administration of the entire revenues of all the congregations of the believers (i.e., the Monophysites) in Constantinople and everywhere else." Willing to root out heathenism in Asir Minor, obviously for political as well as religious reasons, the emperor appointed John to be his missionary bishop. In this task he had great success, to which his faithful friend and fellow labourer for thirty years, Deuterius, largely contributed. He interested himself, too, in the missionary efforts of Julian, Theodore, and Longinus among the Nubians and Aloda. In 546 the emperor employed him in searching out and putting down the secret practices of idolatry in Constantinople and its neighbourhood. After the death of his patron the fortunes of John soon underwent a change. Bk. i of the third part of his *History* commences with the persecution under Justin in 571, in which he suffered imprisonment. His friend Deuterius, whom he had made bishop of Carr, was also persecuted, and died at Constantinople. From this time forward John's story is that of his party, and the evidently confused and disordered state of his *History* is fully explained and excused by his own words in bk. ii 50, where he tells us "that most of these histories were written at the very time when the persecution was going on, and under the difficulties caused by its pressure, and it was even necessary that friends should remove the leaves on which these chapters were inscribed, and every other particle of writing, and conceal them in various places, where they sometimes remained for two or three

years. When therefore matters occurred which the writer wished to record, it was possible that he might have partly spoken of them before, but he had no papers or notes by which to read and know whether they had been described or not. If therefore he did not remember that he had recorded them, at some subsequent time he probably again proceeded to their detail, and therefore occasionally the same subject is recorded in more chapters than one, nor afterwards did he ever find a fitting time for plainly and clearly arranging them in an orderly narrative." Some of the chapters are actually dated at various times from A Gr 886 (575 A D) to 896 (585). The time and place of his death are unknown, but he cannot have lived long after 585, being then about eighty years of age. His greatest literary work is his *Ecclesiastical History* in three parts, the first two of which, as he himself tells us, embraced, in six books each, the period from Julius Caesar to the seventh year of Justin II, whilst the third, also in six books, carried on the tale to the end of the author's life. The first part is entirely lost. Of the second we have copious excerpts in the *Chronicle* of Dionysius of Tell Mahrē and in two MSS in the British Museum. The third has fortunately come down to us, though with considerable lacunae, in Brit Mus Add 14640 (of the 7th century). This book is worthy of all praise for the fulness and accuracy of its information and the evident striving of the author after impartiality. The Syriac style, however, is very awkward and involved, and abounds in Greek words and phrases. Of scarcely less value for the history of his own time is another work entitled *Biographies of Eastern Saints*, men and women, contained in Brit Mus Add 14647, ff. 1-135. These lives were gathered into one corpus about 569, as appears from the account of the combination of the monasteries of Amid during the persecution of 521, which was put on paper in 567, and from the history of the convent of St John, extending from its foundation in 389 to 568. To these lives Land has added three more, which are ascribed in MSS to John, but do not seem to have been included in this collection.

The name of Zacharias Rhetor or Scholasticus, bishop of Mitylēnē Zachar in Lesbos, must next be mentioned, for, though a Greek author, his work has entered into the Syriac literature as part of a compilation by a Syrian monk. The *Ecclesiastical History* of Zacharias seems to have terminated about the year 513, whereas his Syriac translator was writing as late as 569, and even later. The MS in the British Museum, Add 17202, cannot be younger than the beginning of the 7th century, and is clearly the compilation of a Monophysite, who used Zacharias as his chief authority in books iii vi, whereas books i, ii, and vii were gathered from different sources, such as Moses of Aggēl (about 550-570), Simeon of Beth Arshām (see above, p. 832), Mari of Amid (see above, p. 833), the correspondence of Julian of Illicianussus and Severus of Antioch (see above, p. 834), the history of John of Ephesus, &c. In a Syriac MS in the Vatican (No. clvi) we find a series of extracts from this Syriac work (f. 78 sq.) as a continuation of copious excerpts from the Greek histories of Soerates and Theodoret. The last of these, on the public buildings, statues, and other decorations of the city of Rome, has been carefully re-edited and annotated by Guidi.

We turn from the historians to the ascetic writers of this century, who seem to have been more prized by their countrymen, though far less valuable to us. And first we mention the author who is commonly called John Sābhā or "the Aged," placing him here on John the authority of Assemani (*B O*, i 433), for 'Abd al-shā' claims him Sābhā as a Nestorian (*B O*, iii 1, 103). His *floruit* is given as about

¹⁹ See Land, *Joannes Dithochron Ephesos, der erste Syrische Kirchenhistoriker*, 1850. A very useful book.

historian at Tabari, who treats it as a genuine historical document.¹ From him it has passed to the *Kāmil* of Ibn al Athir, i 283 sq., and the *Alkabar* of Bakri of Abu 'l Idris (*His. Islamica*, ed. Leischer, p. 84). Ibn Wāḥib al-Yakūbi seems in his *Annals*² to have drawn from the same source, though independently of at Tabari, and so also al Mas'ūdī, *Murūj adh Dhahab*, ii 323. Bar Hebraeus has also made some use of it in his *Chronicon*, ed. Bruns and Kirch, pp. 68-69. No doubt, too, it is the work attributed by 'Abd al-ḥū' to the grave ecclesiastical historian Socrates, who, as he says,³ wrote "a history of the emperors Constantine and Julian."

Another, but much inferior, romance, of which Julian is the hero, is contained in Brit Mus. Add. 7192, a manuscript of the 7th century. It has been edited by Hoffmann, *op. cit.*, pp. 242-259, and translated by Noldeke, *J D M G.*, lxxviii 660-674. We shall not be far wrong in assigning it likewise to the 6th century, though it is probably rather later than that just noticed.

Of real historical value, on the contrary, is the anonymous *Chronicon Iudeorum*, fortunately preserved to us in the Vatican MS. Lat. 4, and edited by Assemani in *B O.*, i 388-417. There is an English translation of it in the *Journal of Sacred Lit.*, 1864, vol. i (new ser.), p. 28 sq. It begins with A. G. 180, but the entries are very sparse till we reach A. G. 613 (202 A. D.). The last of them refers to the year 540, about which time the little book must have been compiled. The author made use of the archives of Iudaea and other documents now lost to us, as well as of the *Chronicle* of Isidore the Stylite (see above, p. 832). In religious matters he is not a violent partisan, nor given to the use of harsh words, a thing to be noted in the age in which he lived.

Another writer of first rate importance as a historian is John, bishop of Am or Ephesus, "the teacher of the heathen," "the over-seer of the heathen," and "the idol breaker," as he loves to style himself.⁴ He was a native of Amid,⁵ and must have been born early in the 6th century, according to Land about 505. He was ordained deacon in the convent of St John in 520, when he must have been at least twenty years of age.⁶ In 534 the terrible prevalence of the reign of Justinian broke out, and at that time John was in Palestine,⁷ having, doubtless, fled from Amid to avoid the persecution of the Monophysites by Abraham bar Iah (†) of Tellā, bishop of Amid (from about 520 to 546), and Ephraim bar Appara of Amid, patriarch of Antioch (529-544), "a much worse persecutor than Paul or Euphrasius."⁸ In 535 we find him at Constantinople, where in the following year, according to Bar Hebraeus,⁹ he became bishop of the Monophysites in succession to the deposed Anthimus. Be this as it may, he was certainly received with great favour by Justinian, whose friendship and confidence he enjoyed for thirty years, and "had the administration of the entire revenues of all the congregations of the believers (i. e., the Monophysites) in Constantinople and everywhere else."¹⁰ Wishing to root out heathenism in Asia Minor, obviously for political as well as religious reasons, the emperor appointed John to be his missionary bishop.¹¹ In this task he had great success, to which his faithful friend and fellow labourer for thirty-five years, Dauticus, largely contributed.¹² He interested himself, too, in the missionary efforts of Julian, Theodore, and Longinus among the Nubians and Aload.¹³ In 546 the emperor employed him in searching out and putting down the secret practice of idolatry in Constantinople and its neighbourhood.¹⁴ After the death of his patron the fortunes of John soon underwent a change. Bk. i of the third part of his *History* commences with the persecution under Justin in 571, in which he suffered imprisonment.¹⁵ His friend Dauticus, whom he had made bishop of Caria, was also persecuted, and died at Constantinople.¹⁶ From this time forward John's story is that of his party, and the evidently confused and disordered state of his *History* is fully explained and excused by his own words in bk. ii 50, where he tells us¹⁷ "that most of these histories were written at the very time when the persecution was going on, and under the difficulties caused by its pressure, and it was even necessary that friends should remove the leaves on which these chapters were inscribed, and every other particle of writing, and conceal them in various places, where they sometimes remained for two or three

years. When therefore matters occurred which the writer wished to record, it was possible that he might have partly spoken of them before, but he had no papers or notes by which to read and know whether they had been described or not. If therefore he did not remember that he had recorded them, at some subsequent time he probably again proceeded to their detail, and therefore occasionally the same subject is recorded in more chapters than one, nor afterwards did he ever find a fitting time for plainly and clearly arranging them in an orderly narrative." Some of the chapters are actually dated at various times from A. G. 886 (575 A. D.) to 896 (585). The time and place of his death are unknown, but he cannot have lived long after 585, being then about eighty years of age.¹⁸ His greatest literary work is his *Ecclesiastical History* in three parts, the first two of which, as he himself tells us,¹⁹ embraced, in six books each, the period from Julius Caesar to the seventh year of Justin II, whilst the third, also in six books, carried on the tale to the end of the author's life. The first part is entirely lost. Of the second we have copious excerpts in the *Chronicle* of Dionysius of Tell Mahrā²⁰ and in two MSS in the British Museum.²¹ The third has fortunately come down to us, though with considerable lacuna, in Brit Mus. Add. 14640 (of the 7th century).²² This book is worthy of all praise for the fulness and accuracy of its information and the evident striving of the author after impartiality. The Syriac style, however, is very awkward and involved, and abounds in Greek words and phrases. Of scarcely less value for the history of his own time is another work entitled *Diographies of Eastern Saints*, men and women, contained in Brit Mus. Add. 14647, ff. 1-135.²³ These lives were gathered into one corpus about 560, as appears from the account of the combination of the monasteries of Amid during the persecution of 521, which was put on paper in 567,²⁴ and from the history of the convent of St John, extending from its foundation in 389 to 568.²⁵ To these lives Land has added three more, which are ascribed in MSS to John, but do not seem to have been included in this collection.²⁶

The name of Zacharias Rhetor or Scholasticus, bishop of Mytilene Zacharias in Iesbos,²⁷ must next be mentioned, for, though a Greek author, his work has entered into the Syriac literature as part of a compilation by a Syriac monk. The *Ecclesiastical History* of Zacharias seems to have terminated about the year 518, whereas his Syriac translator was writing as late as 569,²⁸ and even later. The MS in the British Museum, Add. 17202,²⁹ cannot be younger than the beginning of the 7th century, and is clearly the compilation of a Monophysite, who used Zacharias as his chief authority in books ii, iii, where books i, ii, and iii were gathered from different sources, such as Moses of Aggel (about 550-570), Simeon of Beth Arshām (see above, p. 832), Mārī of Amid (see above, p. 833), and the correspondence of Julian of Ilaharnassus and Severus of Antioch (see above, p. 834), the history of John of Ephesus,³⁰ &c. In a Syriac MS in the Vatican (No. exli) we find a series of extracts from this Syriac work (f. 75 sq.) as a continuation of copious excerpts from the Greek histories of Socrates and Theodoret. The last of these, on the public buildings, statues, and other decorations of the city of Rome, has been carefully re-edited and annotated by Guidi.³¹

We turn from the historians to the ascetic writers of this century, who seem to have been more prized by their countrymen, though far less valuable to us. And first we mention the author who is customarily called John Sābhā³² or "the Aged," placing him here on John the authority of Assemani (*B O.*, i 433), for 'Abd al-ḥū' claims him Sābhā as a Nestorian (*B O.*, iii 1, 103). ³² *Catal.*, iii 253, *F O.* ii 64 sq. Mal. *Scriptorium I clerum Nova Collectio* x pp. xi xiv 322-325. The MS, which Assemani calls periclitus Syriac,

is not likely to be earlier than the middle of the 6th century, as it contains a work of the patriarch Elias, who sat from 708 to 725.

³³ *Il Teste Siriano della Descrizione di Roma &c.* from the *Bullettino della Commissione Archeologica di Roma*, fasc. li anno 1884 (Rome, 1884). It is also

extant in a shorter form in Brit. Mus. Add. 12164, f. 1-13 (see Wright, *Catal.*, p. 984. Guidi, p. 235 sq.).

³⁴ There is some uncertainty about his name. In *B O.*, i 434 Assemani gives

ܝܫܝܐ ܡܪܝܬܐ ܡܪܝܬܐ, John of Dīlāhā which he says (p. 433) is a

convent at Nineveh, on the opposite bank of the Tigris from Mosul. In vol.

iii 1, 103 he prints ܝܫܝܐ ܡܪܝܬܐ ܡܪܝܬܐ, which he renders Johannes

Ca 1, r 21

Psalter as Brit Mus Add 7156¹ and Munich, cod Syr 4 (Orient 147)². Hymns of his are also extant.³

Abraham of Kashkar Under Mār abhā flourished Abraham of Kashkar (al Wāsit), distinguished for his acquaintance with philosophy and for his ascetic virtues. He introduced certain reforms into the Persian monasteries. After living for some time in a cave at Hazzah,⁴ he betook himself to Jerusalem and thence to Egypt. Returning to his old haunt, he led the life of a hermit for thirty years, travelling into the far north as a missionary. He died at Hazzah, but his body was secretly removed to his native place Kashkar. He wrote a treatise on the monastic life, which was translated into Persian by his disciple Ishō the monk.⁵

He must, it would seem, be distinguished from another Abraham of Kashkar, who lived about the same time, and with whom Assemani has confounded him.⁶ This Abraham was a student at Nisibis under Abraham the nephew of Narsai. Thence he went to Hītī (al Hārīh), where he converted some of the heathen inhabitants, visited Egypt and Mount Sinai, and finally settled down as a hermit in a cave on Mount Lāz, near Nisibis, where a great number of followers soon gathered about him and a large monastery was built. He introduced stricter rules than heretofore among the canobites.⁷ His death did not take place till towards the end of the century.⁸

Theodore of Merv Theodore, bishop of Mārī or Merv, was appointed to this see by Mār abhā in place of Dīnāl, whom he had deposed, about 540. He seems to have been much addicted to the study of the Aristotelian dialectics, since several of the translations and treatises of Sergius of Rīstīm are dedicated to him.⁹ Among his own works¹⁰ there is mentioned "a solution of the ten questions of Sergius." He also composed a commentary on the Psalms and a metrical history of Mār Iugennā and his companions,¹¹ who came from Klysina and introduced asceticism into Mesopotamia about the beginning of the 6th century. What may have been the contents of the "liber varii argumenti" which he wrote at the request of Mār abhā himself it is hard to guess in the default of any copy of it.

Gabriel of Hormizdshūr Theodorus brother Gabriel, bishop of Hormizdshūr,¹² is stated by 'Abhid ishō'¹³ to have written two controversial books against the Manichees and the Chaldeans (astrologers), as also about 300 chapters on various passages of Scripture which needed elucidation and explanation.

Joseph of Selencia The successor of Mār abhā in the see of Selencia was Joseph, in 552. He studied medicine in the West and practised in Nisibis, where he lived in one of the convents. Having been introduced by a Persian noble to the notice of Khosrau I, he cured that monarch of an illness, and ingratiated himself with him so much that he procured his appointment to the office of catholicus. Of his strange pranks and cruelties as archbishop so no account, doubtless highly coloured, may be read in *BO*, iii 1, 432-433, and Bar Hebraeus, *Chron Eccles*, ii 95-97. He was deposed after he had sat for three years, but he lived twelve years longer, during which time no successor was appointed. He promulgated twenty three canons,¹⁴ and, according to Ibas, bishop of Damascus (893),¹⁵ after his deposition drew up a list of his predecessors in the dignity of catholicus, wherein he would seem to have paid special attention to those who had shared the same fate with himself. At least Bar Hebraeus¹⁶ (perhaps not a quite trustworthy witness in this case) gives currency to the charge of his having forged the consolatory epistles of Jacob of Nisibis and Mār Ephraim to Pāpī of Selencia on his deposition.

Paul the Persian A little later in the century, under the sway of his successor Ezekiel (a disciple of Mār abhā and the son in law of his predecessor Paul), 567-580,¹⁷ there flourished Paul the Persian,¹⁸ of Dīrshahr or Dīrshahr,¹⁹ a courtier of Khosrau I Anōshirvān.²⁰ He is said by Bar Hebraeus²¹ to have been distinguished alike in ecclesiastical and philosophical lore, and to have aspired to the post of metropolitan

bishop of Persis, but, being disappointed, to have gone over to the Zoroastrian religion. This may or may not be true, but it is certain that Paul thought more of knowledge than faith, for thus he speaks:²² "Scientia enim agit de rebus proximis et manifestis atque seiri possunt, fides autem de omnibus maternas quæ remotæ sunt, neque conspiciuntur neque certa ratione cognoscuntur. Hæc quidem cum dubio est, illa autem sine dubio. Omne dubium discessionem parit, dubii absentia autem unanimitatem. Scientia igitur potior est fide, et illam purò hæc eligendum est." Bar Hebraeus speaks of Paul's "admirable introduction to the dialectics (of Aristotle)," by which he no doubt means the treatise on logic extant in a single MS in the Brit Mus.²³ It has been edited, with a Latin translation and notes, by Land.²⁴

About this same time Assemani²⁵ places the periodontes Bōdhī, who Bōdhī is said to have had the charge of the Christians in the remote districts of the Persian empire as far as India. Among his writings are specified "discourses on the faith and against the Manichees and Marcionites," as well as a book of "Greek questions," probably philosophical, bearing the strange title of *Alēph Mīgīn*.²⁶ All these have perished, but his name will go down to remote posterity as the translator into Syriac of the collection of Indian tales commonly called *Kalilah and Dimnah*.²⁷ Of this work a single copy has come down to our time, preserved in an Oriental library. A transcript of it was first procured by Bickell,²⁸ who, in conjunction with Benfey, edited the book (Leipsic, 1876), and since then three additional copies of the same original have been got by Sachau.²⁹ That Bōdhī made his Syriac translation from an Indian (Sanskrit) original, as 'Abhid ishō' asserts, is wholly unlikely, he no doubt had before him a Pahlavi or Persian version.³⁰

Just at this period the Nestorian Church ran a great risk of disruption from an internal schism. Hamaṇnā of Hūdhayāh, of Hīt, the successor of Joseph Hīzāyā in the school of Nisibis, who had, it is said, a following of 800 pupils,³¹ had dared to assail the doctrines and exegesis of Theodore of Mopsuestia and to follow in some points those of Chrysostom.³² He commenced his work at Nisibis, under the metropolitan Abā dī'abhū(h),³³ by publishing a revised edition of the statutes of the school.³⁴ During the time of the catholicus Ezekiel (567-580)³⁵ he brought forward his theological views, which were condemned at a synod held under the next catholicus, Ishō'abbā of Arzōn (581-595),³⁶ and at another synod presided over by his successor, Sabhr ishō' (596-604).³⁷ On the death of this latter a struggle took place between the rival factions, the orthodox Nestorians putting forward as their candidate Gregory of Tell Besmā,³⁸ bishop of Nisibis, whilst the others supported Gregory of Kashkar, a teacher in the school of Mīhōzē or Shkh (Selencia).³⁹ The influence of the Persian court decided the matter in favour of the latter, who was a *persona grata* in the eyes of the queen Shmūn and her physician Gabriel of Shuggār (Sujiar),⁴⁰ a keen Monophysite, who naturally availed himself of this opportunity to harm the rival sect of Christians. Gregory was not, however, a partisan of Hamaṇnā, but an orthodox Nestorian, as appears from the account given of the synod over which he presided,⁴¹ by which the Nicene creed was confirmed, the commentaries of Theodore of Mopsuestia approved, and the memory and writings of Bar saumā indicated against his assailants. He died at the end of three years (607), and the archiepiscopal see remained vacant till after the murder of Khosrau II Parwēz in 628, during which time of persecution Bābhāi the archimandrite distinguished himself as the leader and guide of the Nestorian Church. In the overthrow of Khosrau the oppressed Nestorians bore a part, more especially Shamtā⁴² and Kurta, the sons of the noble Yazdān, who had been the director of the land tax of the whole kingdom and had amassed an enormous fortune, which the king confiscated.⁴³ To return to Hamaṇnā, his works, as enumerated by 'Abhid ishō',⁴⁴ are—commentaries on Genesis, Job, Psalms, Proverbs, Ecclesiastes, the Song of Songs, the twelve minor prophets, the Gospel of St Mark, and the epistles of St Paul, expositions of the (Nicene) creed and the liturgy, on the occasions of the celebration of Palm

Sundar, Golden Friday, rogations,² and the invention of the cross, a discourse on Palm Sunday and various other writings in which he attracted the teaching of Theodore of Mopsuestia, and which the church therefore placed on its *index expurgatorius*.³

To explain the doctrine of Hinninā found a warm champion in Joseph of Hazzā (Arbī or Irbī),⁴ with whom Bibhai the archimandrite entered into controversy.⁵ He is said to have composed some 1900 tracts, of which Abdišō mentions about a dozen as "profitable," whence we may conjecture that the rest were more or less superficial and with little value. The chief of them are—on theory (or speculation) and practice, the book of the treasurer, containing the solution of all true questions, on misfortunes and chastisements, on the reasons of the principal feasts of the church, the book of the histories of the Paradise of the Orientals, containing many notices of ecclesiastical history, an exposition of the vision of Ezekiel and of the vision of St. Gregory, of the book of the merchant, of (pseudo) Dionysius (the Areopagite), and of the *capita scientiarum* or heads of knowledge (of I vagrus), besides epistles on the exalted character of the monastic life. Joseph appears to have been made a bishop in his latter days, and to have taken the name of 'Abdišō, at least a MS in the India Office (No. 9) contains a tract on *Seh* 10 (f. 241b), and three series of questions addressed by a pupil to his teacher, by 'Mān Abdišō, who is Joseph Hazzān (f. 202a).

The successor of Ezekiel as catholicus of the Nestorians was Ishō yabīh of Arzōn, 581-595.⁶ He was a native of Bēth 'Arbūyē, educated at Nisibis under Abraham (see above, p. 836), and subsequently made bishop of Arzōn (*Apfayrā*). He managed to ingratiate himself with the Persian monarch Hormizd IV (579-590), by whose influence he was raised to the archiepiscopate, and he continued to stand in favour with his son and successor Khosrau II Parwēz, as well as with the Greek emperor Maurice. Doubtless both found the Christian archbishop a convenient ambassador and agent in public and private affairs, for Maurice had given his daughter Maria in marriage to Khosrau.⁷ He was also a friend of the Arab king of Hīrā (al Hīrah), Abū Kābūs Nu mān ibn al Mundhir, who had been converted to Christianity, with his sons, by Simeon, bishop of Hīrā, Sabhrishō, bishop of Lishōm, and the monk Ishō zakkī.⁸ On a pastoral visit to this part of his diocese, the catholicus was taken ill, and died in the convent of Hind (the daughter of Nu mān) at al Hīrah. Among his works are mentioned a treatise against Eunomius, one against a heretical (Monophysite) bishop who had entered into argument with him, twenty-two questions regarding the sacraments of the church,⁹ an apologetic and synodical canons and epistles.

Abdišō zakkī, also called Ishō zakkī or Zakkāishō, was a monk of Mount Izī.¹⁰ When many of his brotherhood were expelled from their convent by Bibhai the archimandrite, he betook himself to the district of Dāsen¹¹ and founded there a monastery, which was henceforth known as Bēth Rabban Zakkāishō or, for shortness sake, Bēth Rabban simply.¹² He was the author of an ecclesiastical history, which Abdišō praises as being "exact."

Dabīshō is the successor of Abraham of Kashkar as abbot of the great convent on Mount Izī,¹³ apparently during the lifetime of the latter who lived to a great age (see above p. 837).¹⁴ He composed a treatise on the monastic life and another entitled *On Silence in Body and in Spirit* a discourse on the consecration of the cell besides funeral sermons and epistles. He also translated or edited a commentary on *The Paradise of the Western* *Heaven* probably meaning the *Paradise of Palladius* and Jerome), and annotated the works of Isidore of Seville.¹⁵

He is about too in the date of the monk Bar-Idtā, the founder of the convent of Lishōm, his name, a contemporary of Bibhai of Hīrā and Ishō yabīh of Arzōn. He was the author of a monastic history which is often quoted by Thomas of Margā,¹⁶ and seems to

have been a work of considerable value. He must be distinguished from a later Bar-Idtā, of the convent of Sēbbā, near the village of Hēghlā on the Tigris,¹⁷ with whom Assemani has confounded him.¹⁸

In the *Bibl. Orient.*, iii. 1, 230, 'Abdišō mentions an historian Simeon whose name is given by Assemani as Simeon Karbāyā, with the Barlāwā additional information that he was bishop of Karbāyā and flourished under the patriarch Timothy I about 800. His name seems, however, to have been wrongly read, and he appears to have lived at a much earlier date. At least Elias bar Shūnāyā speaks in his *Chronicle* of one Simeon Barlāyā¹⁹ as the author of a *Chronicle* (in at least two books), who wrote in the reign of the Persian king Khosrau II Parwēz, A. G. 902=591 A. D.

The name of Sabhrishō the catholicus carries us over into the Sabhr-7th century. He was a native of Pērōz ābādīh in Bēth Garma, Ishō became bishop of Lishōm, and was raised to the archiepiscopate in 596 by the favour of Khosrau II Parwēz.²⁰ On the murder of his father in law Maurice (November 602), Khosrau resolved upon war, and took the field in 604, when he besieged and captured the fortress of Dārī, the first great success in a fearful struggle of twenty-five years. Bar-Hebraeus states that Sabhrishō accompanied him and died during the siege,²¹ but other authorities say, doubtless more correctly, that he died at Nisibis.²² He is said to have been the author of an ecclesiastical history, of which a fragment, relating to the emperor Maurice, was supposed to be extant in Cod. Vat. clxxxviii., but Guriel has shown that this is incorrect, and that the said fragment is merely an extract from a legendary life of Sabhrishō by some later hand (*Z. D. M. G.*, vi. pp. 559-561).²³

About the same time with Sabhrishō, if Assemani be right,²⁴ we Simeon may place Simeon of Bēth Garma, who translated into Syriac the of Bēth *Chronicle* of Eusebius. This version seems unfortunately to be Garma entirely lost.

With the 7th century begins the slow decay of the native literature of the Syrians, to which the frightful sufferings of the people Græco during the great war with the Persians in its first quarter largely Persian contributed.²⁵ During all those years we meet with scarcely a name of any note in letters, more especially in western Syria. Paul of Tellā and Thomas of Harkel were, it is true, labouring at the revised versions of the Old and New Testaments in Alexandria,²⁶ but even there they were scared by the Persian hosts, who took possession of the city in 615 or 616, shortly after the capture of Jerusalem by another army in 614.²⁷ A third diligent worker under the same adverse circumstances was the abbot Paul, who fled from Abbot his convent in Syria to escape the Persian invasion, and took refuge Paul in the island of Cyprus. Here he occupied himself with rendering into Syriac the works of Gregory Nazianzen.²⁸ Of this version, which was completed in two volumes in 624, there are several old MSS in the British Museum.²⁹ This Paul was also the translator of the *Odotheus* of Severus, of which there is a MS in the British Museum, Add. 17134, dated 675.³⁰ To this collection he himself contributed a hymn on the holy chrism and a translation of the "Gloria in excelsis."

The name of Mārūthā³¹ is the first that deserves mention here, Mārūthā, more, however, on account of his ecclesiastical weight and position of Tagh than his literary merit. He was a native of Shurak (?), a village with in the diocese of Bēth Nuhādhrē,³² was ordained priest in the convent of Nardus, lived for twenty years in the convent of Zakkāyā or Zachreus at Callinicus (or Rakkāyā), and went thence to Edessa for purposes of study. On returning to the East, he resided in the convent of Mār Matthew at Mosul, where he occupied himself with remodelling its rules and orders. He sided with the Monophysite party at the Persian court, and, after the death of the physician Gabriel,³³ found it advisable to retire to 'Akōlā (al Kūfah).³⁴ He was elevated to the dignity of metropolitan bishop of Tagh rā in 640, after the establishment of peace between the Græcs and

³⁹ See the list series of MSS described in Wright's *Catal.*, pp. 423-428. One of these is dated 700, another 740. Two other MSS (*ibid.*, pp. 436-439) seem to contain part of the older version of the Nestorians (*D. O.*, III. 1, 24, note 1).

⁴⁰ Wright *Catal.*, p. 239. The translator is wrongly described in the codex as a bishop of Edessa (see above, p. 634 note 15). His convent was probably that of Kenneh, of which both John bar Aphthōnyā (see above, p. 833) and John Parthēs or Calligraphus were abbots. Compare *D. O.*, II. 64.

⁴¹ *D. O.* II. 416, 415.

⁴² See Hoffmann *Auszüge*, pp. 209-210 but especially p. 215.

⁴³ See above, p. 83.

⁴⁴ Bar Hebraeus, *Chron. Eccles.*, II. 111, *D. O.*, II. 416.

Persians¹ and was the first real maphrian (maphrianā) and organizer of the Jacobite Church in the East, which so rapidly increased in numbers and influence that he was called upon to ordain bishops for such remote regions as Segestān (Sistān) and Harīn (Harit) Mārīthī died in 640. His life was written by his successor Denhā². Mārīthī compiled a liturgy and wrote a comment on the Gospels, both of which are sometimes wrongly assigned to the elder Mārīthī of Uperkat³. He was also the author of short discourses on New (or Low) Sunday, and on the consecration of the water on the eve of the Epiphany, as well as of some hymns and seals.⁴

Severus
Schohkt
Contemporary with Mārīthī, under the patriarch Athanasius Gammālī (died in 611) and his successor John, flourished Severus Schohkt of Nisibis, bishop of the convent of Ken neshit, at this time one of the chief seats of Greek learning in western Syria.⁵ He devoted himself, as might be expected, to philosophical and mathematical as well as theological studies.⁶ Of the first we have specimens in his treatise on the syllogisms in the *Analytica Priora* of Aristotle, his commentary on the *Heptameron*, and his letters to the priest Antilīhī of Masul on certain terms in the *Heptameron*, and to the peripatetics in Nisibis or Joras on some points in the logic of Aristotle.⁷ Of his astronomical and geographical studies there are a few examples in Brit Mus Add 14535, ff 153-155,⁸ such as whether the heaven surrounds the earth in the form of a wheel or sphere, on the habitable and uninhabitable portions of the earth, on the measurement of the heaven and the earth and the space between them, and on the motions of the sun and moon.⁹ In the Royal Library at Berlin there is a short treatise of his on the astrolabe.¹⁰ More or less theological in their nature are his letter to the priest and peripatetics Basil of Cyprus, on the 14th of Nisan, A. G. 976 (665 A. D.),¹¹ a treatise on the weeks of Daniel,¹² and letters to Sergius, abbot of Shiggar (Sijir), on two discourses of Gregory Nazianzen.¹³ He is also said to have drawn up a liturgy.¹⁴

John I
John I, Jacobite patriarch of Antioch, was called from the convent of Lūsbhūnī at Tell 'Addī to the archiepiscopal throne in 631, and died in December 648.¹⁵ Bar-Hebraeus tells us that he translated the Gospels into Arabic at the command of the Arab emir 'Amr ibn Sa'īd. He is better known as the author of numerous sedrī and other prayers, whence he is commonly called Yohannān dē sedrīn (John), or "John of the Sedrīs". He also drew up a liturgy.¹⁶

Muham
mad
conquer
of Syria
During the second quarter of this century, from 633 to 636, the Muhammadan conquest of Syria took place. The petty Arab kingdoms of the Lakhmītes (al Lakhmī), the Thālabites and Kindites, and the Ghassanītes, as well as the wandering tribes of Mesopotamia, were absorbed, and the Persians were beaten back into their own country, quickly to be overrun in its turn. The year 638 witnessed the last effort of the Greek empire to wrest Syria from the invaders, the Muslim yoke was no longer to be shaken off. The effects of this conquest soon began to make themselves manifest in the literature of the country. The more the Arabic language comes into use, the more the Syriac wanes and wastes away, the more Muhammadan literature flourishes, the more purely Christian literature pines and dwindles, so that from this time on it becomes necessary to compile grammars and dictionaries of the old Syriac tongue, and to note and record the correct reading and pronunciation of words in the Scriptures and other books, in order that the understanding of them may not be lost.

Jacob of
Edessa
Among the small band of Monophysite scholars who made themselves conspicuous during the latter half of the 7th century the most famous name is that of Jacob of Edessa.¹⁷ He was a native of 'En dībhī (the Wolf's den), a village in the district of Gumyālī (al Jūmalī), in the province of Antioch. The date of his birth is not mentioned, but it may have been about 640 or a little earlier.¹⁸ He studied under Severus Schohkt at the famous convent of Ken neshit, where he learned Greek and the accurate reading of the

Scriptures. Thence he went to Alexandria, but we are not told how long he remained there. After his return to Syria he was appointed bishop of Edessa in 679-680, but Bar-Hebraeus says that he was ordained by the patriarch Athanasius II, 684-687 which seems more probable, as they were intimate friends. It he was appointed in 684, the three or four years for which he held this office would terminate in 687-688, in which latter year Julian Rōmīyā (or "the Soldier")¹⁹ was elected patriarch. Apparently Jacob was very strict in the enforcement of canonical rules, and thereby offended a portion of his clergy. He would seem to have appealed to the patriarch and his fellow bishops, who were in favour of temporizing, whereupon Jacob burnt a copy of the rules before the gate of Julian's convent, at the same time crying aloud, "I burn with fire as superfluous and useless the canons which ye trample under foot and heed not." He then betook himself to the convent at Kaisūm, a town near Samosāt, and Habbībīh was appointed to Edessa in his stead. After a while the monks of Lūsbhūnī invited Jacob to their convent, and there he taught for eleven years the Psalms and the reading of the Scriptures in Greek, the study of which language had fallen into desuetude. Owing to disputes with some of the brethren "who hated the Greeks," he left this house and went to the great convent at Tell 'Addā, where he worked for nine years more at his revised version of the Old Testament.²⁰ On the death of Habbībīh Jacob was recalled to Edessa, where he resided for four months, at the end of which time he returned to Tell 'Addā to fetch his library and pupils, but died there on 5th June 708.²¹ In the literature of his country Jacob holds much the same place as Jerome among the Latin fathers. He was, for his time, a man of great culture and wide reading, being familiar with Greek and with older Syriac writers. Of Hebrew he probably understood very little, but he was always ready, like Aphrates, to avail himself of the aid of Jewish scholars, whose opinion he often cites. He appears before us as at once theologian, historian, philosopher, and grammarian, as a translator of various Greek works, and as the indefatigable correspondent of many students who sought his advice and assistance from far and near. As a theologian, Jacob wrote commentaries on the Old and New Testaments, which are cited by later authors, such as Dionysius bar Sahbī²² and Bar-Hebraeus, as well as in the large *Calena* of the monk Severus²³, further, scholia on the whole Scriptures, of which specimens may be found in *S. Ephraemi Opera Syn*²⁴ and in Phillips's *Scholia on some Passages of the Old Testament* (1864).²⁵ His discourses on the six days of creation are extant at Leyden and Lyons.²⁶ This was his latest work, being unfinished at the time of his death, it was completed by his friend George, bishop of the Arab tribes. Like many other doctors of the Syriac Church, Jacob drew up a maphrian or liturgy,²⁷ and revised the liturgy of St James, the brother of our Lord.²⁸ He also composed orders of baptism,²⁹ of the consecration of the water on the eve of the Epiphany,³⁰ and of the solemnization of matrimony,³¹ with which we may connect his translation of the order of baptism of Severus³² and the tract upon the forbidden degrees of affinity.³³ The *Book of Timotheus*³⁴ contained expositions of the Eucharistic service, of the consecration of the water, and of the rite of baptism, probably identical with or similar to those which are found separately in MSS.³⁵ He likewise arranged the horologium or canonical hours of the fiscal day,³⁶ and drew up a calendar of feasts and saints' days for the whole year.³⁷ Of his numerous canons,³⁸ those addressed to the priest Addā have been edited by Lamy, *Dressat de Syriacum Fide* &c., p. 98-99, and De Lagarde, *Reliquiae Juris Eccles. Antiquissimae*, p. 117-9.³⁹

¹ According to the calculation of Dionysius of Tell Mahrī, 679-680. So called because he had in his younger days served along with his father in the imperial army. See above p. 82.

² According to Dionysius of Tell Mahrī, B.O. 142, A.D. 710, but Bar-Hebraeus confirms the earlier date. See Baethgen, *Fragmente einer arabischen Hagiographie*, pp. 40, 121.

¹⁷ The dates given in B.O. i 400, seem to be utterly wrong.

the metropolitan of Rān Ardashīr¹ in Persia and of the Kātrīyā,² who refused obedience to him as his diocesan and this led to a lengthy correspondence regarding which see *BO*, in 1 127 136. His works as enumerated by 'Abhidishō, are—*Hippāth Hushshābī* or "Refutation of (Heretic) Opinions"³ written for John, metropolitan of Bēth l'pāt,⁴ and other controversial tracts, consolatory and other discourses in various hymns⁵ and an exhortation to certain novices. He arranged the *Ilmīhrā*⁶ or service book for the Sundays of the whole year, for Lent and for the fast of Nineveh,⁷ and drew up offices of baptism⁸ absolution⁹ and consecration¹⁰. He also wrote a history of the monk Ishō'abrahā, a convert from the religion of Zoroaster and a Christian martyr.¹¹ A large collection of his letters is extant in Cod Vat elvī (*Catal* in 299), a judicious selection from which would be worth printing.¹²

'Anūn i hō' of Hēdhayabā and his brother Ishō'abāh were fellow students at Nisibis with Ishō'abāh III, and afterwards entered the great convent on Mount Izlā. Ishō'abāh subsequently became bishop of Karkaphēthī¹³, but 'Anūn i hō' was seized with a fit of wandering and visited Jerusalem, whence he went on to the desert of Skete in Egypt and made himself thoroughly acquainted with the lives and habits of its monks, regarding whom he had read so much in the *Paradise of Palladius*. On his return he soon founded the great convent because of dissensions that had arisen in it, and betook himself with his brother to the convent of Bēth 'Abhī, where he devoted himself to study and so distinguished himself that he was employed by Ishō'abāh III to assist in arranging the *Ilmīhrā* (see above). 'Anūn i hō' wrote a volume of philosophical divisions and definitions, with a copious commentary, dedicated to his brother¹⁴ and compiled a work on the correct reading and pronunciation of difficult words in the writings of the fathers¹⁵ thus following in the footsteps of Joseph Hārīzā (see above, p. 836) and anticipating Jacob of Edessa and the monks of the convent of Karkaphēthī (see above, p. 826). He was also the author of a treatise entitled *Liber Canonum de Fugitivis*, i.e., on the difficult pronunciation and signification of words that are spelt with the same letters. This has been published, with the additions of Hormizd Ishīk of al Hīrah (died in 873) and another compiler, by Hoffmann *Opuscula Nestoriana*, pp. 249¹⁶. His greatest work, however, was a new recension or reduction, in two volumes of the *Parva* of Palladius and Jerome, with additions collected by himself from other sources and from his own experience.¹⁷ Thus he completed at the request of the patriarch George, and it became the standard work on the subject in the Nestorian convents.¹⁸

John of Bēth Garma (Garmāhāy) called John the Elder, was a disciple of Jacob of Bēth 'Abhī, and his successor as abbot of that convent. After a few months, however, he secretly fled from Bēth 'Abhī and betook himself to a hill near Dikāki¹⁹ in Bēth Garma, where the monastery of Ezuliel²⁰ was soon afterwards built, in which he ended his days.²¹ His works, according to 'Abhidishō,²² are—a collection of legends of knowledge or maxims, rules for novices, a brief chronicle, histories of Abraham, abbot of the great convent on Mount Izlā, of the monk Bar-Jūlī²³ and of Nār Khodhshwā, the founder of the convent of Bēth Hālī (near al Hadhrah, in Mosul), with a discourse and hymns on the last named.

Sabhr i hō' Rustam²⁴ was a native of a village called Hērem, in Hēdhayabā and entered the great convent on Mount Izlā under the abbot Narsai, the successor of Bīthmī. Here, at the request of the monks, he wrote a treatise on the occasion of the celebration of Golden Friday, and also a large volume of disputations against heretics and other theological questions. He migrated thence,

perhaps along with Narsai, to Bēth 'Abhī, where, however, he resided only for a short time, being invited by the monks of Bēth Kāki²⁵ to become their prior. Here he composed eight discourses on the dispensation of our Lord, the conversion of the various countries by the Apostles, and on continence and the monastic life. Further, at the request of Mār Kārdagh, the synellus of Ishō'abāh III, he wrote lives of Ishō' Zakkā (of the convent of Gassā), of Ishō'abāh III, of Abraham abbot of Bēth 'Abhī, who came thither from the convent of Zakkā i hō,²⁶ of Kām Ishō' abbot of Bēth 'Abhī,²⁷ of Abraham of Nethpar, of rabhrā Ivōbh (or Job) the Persian, and of the elder Sabhr i hō, the founder of the convent of Bēth Kāki,²⁸ to which may be added the lives of the brothers Joseph and Abraham.²⁹

George, the pupil and successor of Ishō'abāh III, was a native of Geor Kaphrī in Bēth Garma, a district of Bēth Garma.³⁰ His parents Kā were wealthy, and owned two farms in the neighbourhood of the convent of Bēth 'Abhī. Being sent to take charge of these, he got acquainted with the monks and ultimately joined their body. When Ishō'abāh was promoted to the patriarchate, he appointed George to be metropolitan of Hēdhayabā in his stead³¹, and on the death of his friend, George succeeded to the patriarchate in 661, and sat till 680. As an author he is not of much account, having written merely a few homilies, with hymns and prayers for certain occasions, and published nineteen canons.³² His too in all probability is the "epistola dogmatica" contained in Cod Vat ecelvī, p. 360.³³

Līas, bishop of Marā or Merv, was one of those who were present there at the death of Ishō'abāh III and elected George as his successor.³⁴ Merv He compiled a *Calena patrū* (*Mallaphānūthā dhē Kadhānā*) on the four Gospels, and wrote commentaries on Genesis, Psalms, Proverbs, Ecclesiastes, the Song of Songs, Ecclesiasticus, Isaiah, the twelve minor Prophets, and the epistles of St Paul. His letters would probably be of some interest to us, and the loss of his ecclesiastical history, to which 'Abhidishō' applies the epithet of "trustworthy," is to be regretted.³⁵

Of Daniel bī Maṣam we can only say that he flourished under Daniel Ishō'abāh III of Hēdhayabā, about 650.³⁶ He wrote an ecclesiastical history in four volumes, and an explanation of the calendar. Marv The history is cited by George of Arbēl in the 10th century for the date of the destruction of Jerusalem.³⁷

Gabriel, surnamed Taurthā, was a native of the province of Gabrīl Sūzūr or Shahrzūr.³⁸ He studied at Nisibis, and then entered Taur the great convent on Mount Izlā, where he took part in a controversy with the Monophysite monks of the convent of Kartamin (near Mārchā) and against Sīdhōnī. He afterwards migrated to Bēth 'Abhī, where he wrote a life of Mār Narsai the abbot, an account of the martyrs of Tūr Bēlīm or Tūr Bēlīm (Ishurparwī, Mūhransai and their sister Mīdhokht, in the ninth year of Sapor II), a homily for the washing of the feet, &c.³⁹ He became abbot of Bēth 'Abhī under the catholicus Hēnān i hō I (686-701).⁴⁰

Hēnān i hō I, called the Elder or the Lame (*hōghtrā*) was an Hēn pointed catholicus in 686,⁴¹ in succession to John bar Mārā,⁴² the son of George. He was opposed by Ishō'abāh of al Basrah, whom he threw into prison but afterwards released on his making his submission. A more serious rival was John of Dāse, bishop of Nisibis, surnamed the Leper, who carried favour with the caliph 'Abd al Malik ibn Marwān and procured the deposition of Hēnān i hō, whose place he occupied for nearly two years.⁴³ Bar-Hebraeus adds⁴⁴ that John put him for some days into prison, and then sent him off to a convent among the mountains in charge of two of his disciples, who threw the luckless catholicus down a precipice and left him there for dead. Luckily he was found by some shepherds, who took good care of him, though he seems to have been lame ever after. On his recovery he withdrew to the convent of Yannān (or Tōnah)⁴⁵ near Mosul, where he stayed till the death of his rival. He continued to rule the Nestorian Church till 701,⁴⁶ and was buried

mentary on the theological discourses of Gregory Nazianzen and various forms of ordination.¹

Timothy I was a native of Harzā in Ḥāḥayābā, and had been a pupil of Abraham bar Dīshamādā (see above, p. 841) at the school of Bīshūn in Ḥāḥayābā. He became bishop of Bēth Ḥāḥayābā, and stood well with the Muhammadan governor of Mosul, Abū Mūsā ibn Mūsā, and his Christian secretary Abū Nūh al Aḥbār.² On the death of Ḥāḥayābā II in 779,³ several persons presented themselves as candidates for the dignity of catholicus. Timothy got rid of Ḥāḥayābā, abbot of Bēth Ḥāḥayābā, by pointing out to him that he was an old man, unfit to withstand his younger rivals, and by promising, if he himself were successful, to make him metropolitan of Ḥāḥayābā, which he afterwards did. Meantime Thomas of Harzā and other bishops held a synod at the convent of Mār Pethr in Bīghlādā, and elected the monk George, who had the support of 'Isī the court physician, but this formidable opponent died suddenly. Having by a mean trick obtained the support of the archdeacon Bīrō and the heads of the various colleges, Timothy married at last to get himself appointed catholicus about eight months after the death of his predecessor. He still, however, encountered strong opposition. Ephraim metropolitan of Ḥāḥayābā, Solomon bishop of al Ḥadithā, Joseph metropolitan of Mār or Mār, Sergius bishop of Ma'ālāḥyā, and others held a synod at the convent of Bēth Ḥāḥayābā, in which they made Rastān, bishop of Ḥāḥayābā, metropolitan of Ḥāḥayābā in place of Ḥāḥayābā, and excommunicated Timothy, who retorted with the same weapon and deposed Joseph of Mār. Rastān brought the matter before the caliph al Maḥdī, but, failing to gain any redress, in an evil hour for himself became a Muslim convert.⁴ Once more Ephraim summoned his bishops to Bīghlādā and excommunicated Timothy for the second time, with no other result than a counter excommunication and some disgraceful rioting, which led to the interference of 'Isī and the restoration of peace.⁵ Timothy was duly installed in May 780.⁶ He made the bishops of Persia subject to the see of Seleucia, and appointed over them one Simon as metropolitan with orders to enforce a stricter rule than heretofore.⁷ In his days Christianity spread among the Turks, and the khilāfah himself is said to have become a convert.⁸ Timothy's disgraceful response to the caliph al Rashīd in the matter of the divorce of Zubaydah may be seen in *BO*, III, 1, 161. He is said to have died in 204 A. H. = 819-820 A. D., or 205 = 820-821, but, if he really was catholicus for forty-three years, his death cannot have taken place till 823.⁹ 'Abd-Isḥō' informs us that Timothy wrote synodical epistles, a volume on questions of ecclesiastical law, another on questions of various sorts, a third containing disputations with a heretic, viz., the Jacobite patriarch George, about 200 letters in two volumes, a disputation with the caliph al Maḥdī or his successor al-Ḥādī (on matters of religion), and an astronomical work on the stars.¹⁰ Bar Hebraeus adds hymns for the dominical feasts of the whole year and a commentary on Theologus (Gregory Nazianzen).¹¹

In this century too we may place the two following historical writers, whose names and works are unfortunately known to us only through the mention made of them by a later annalist. (1) An anonymous author, the abbot of the great convent of Abraham on Mount Izā, cited by Elias bar Shīnūyā in his *Chronicle* under the years 740-741.¹² (2) An ecclesiastical historian called Pethiōn, identified by Baethgen (*Fragmente*, p. 2, No. 6) with the catholicus of that name. This is, however, impossible, because the catholicus died in 740, whereas the *Ecclesiastical History of Pethiōn* is cited by Elias bar Shīnūyā under the years 765 and 768.

We conclude our enumeration of the Nestorian writers of this century with the name of another historian. In the *Bibl. Orient.*, III,

¹ *BO*, III, 1, 111-113. By the "theology of Gregory Nazianzen" are probably meant the discourses bearing the title *Theologia Prima*, &c., see, for example, Wright, *Catal.*, p. 425, Nos. 22-23.

² Also a pupil of Abraham bar Dīshamādā (*BO*, III, 1, 212 note 2, 169, col. 1). He is mentioned in commendatory terms by Timothy in his enclosed letters of 780 and 800 (*BO*, III, 1, 82 col. 1, 161 col. 1, 'Abd-Isḥō', *Collectio Canonum Synodorum* IX, c. in *Var. Script. Vet. Nova Coll.*, v, pp. 167 col. 1, 829 col. 1). He was the author of a refutation of the Koran, a disputation against heretics, and other useful works (*BO*, III, 1, 212), among which may be mentioned a list of the missionary John of Dailān (*BO*, III, 1, 183, col. 2).

³ Or, according to others, 777.

⁴ Hoffmann, *Auszüge*, p. 310-311.

⁵ We need not believe all the evil that Bar Hebraeus tells us of this unhappy man (*Chron. Eccles.*, II, 171-172).

⁶ See the whole miserable story told in full in *BO*, III, 433, III, 1, 168-169, Bar Hebraeus, *Chron. Eccles.*, II, 165-166.

⁷ Baethgen, *Fragmente*, pp. 64, 181.

⁸ Bar Hebraeus, *Chron. Eccles.*, II, 169. *BO*, III, 433.

⁹ *BO*, III, 1, 160. Compare Chvolson's interesting memoir "Syrische Grabinschriften aus Semirjetzk" (west of the Chinese province of Kulja more correctly Kulja) in *Mem. de l'Acad. Imp. des Sc. de St. Pétersb.*, 7th ser., vol. xxxiv, No. 4. The oldest of these tombstones is dated A. G. 1167 = 853 A. D. and marked "the grave of Mengkū tenesh the believer" (p. 7), but most of them belong to the 13th and 14th centuries.

¹⁰ See *BO*, III, 434, III, 1, 160.

¹¹ *Chron. Eccles.*, II, 179. He is probably the author of the hymn in Brit. Mus. Add. 71.6 (Rosen, *Catal.*, p. 18, col. 1, 1) and Paris, Suppl. 56 (Zotenberg, *Catal.*, p. 9, col. 1).

¹² See Baethgen, *Fragmente*, p. 2, No. 8. Bar Hebraeus, *Chron. Eccles.*, II, 152 note 2, 164 note 1 (Abbeles writes "the abbots of the great convent").

1, 195, the text of 'Abd-Isḥō', as edited by Assenani, speaks of a writer named Isḥō' d-Ḥāḥayābā, bishop of Kaysā. Other MSS, however, Isḥō' read Bīrō (al Basrah), which is confirmed by Elias bar Shīnūyā in his *Chron. Eccles.*, p. 2. The variation Dēnah Isḥō' in Bar Hebraeus (*Chron. Eccles.*, I, 334) is of no consequence, and even there the MSS differ. Besides the usual homilies of sorts and some metrical discourses, he wrote an introduction to logic, a work entitled *The Book of Chastity*, in which he collected lives and anecdotes of holy men and founders of monasteries, and an ecclesiastical history in three volumes.¹³ This valuable work is known to us only by a few citations in Bar Hebraeus and Elias bar Shīnūyā. Those in Bar Shīnūyā¹⁴ range from 624 to 714, but the extract in Bar Hebraeus¹⁵ brings us down to 783.

Returning now to the Jacobite Church, we shall find that the number of its literary men in the 9th century is not large, though some of them are of real importance as theologians and historians.

Dionysius Tell Mahriyā was, as his surname implies, a native of Tell Mahriyā, a village situated between ar Rakkah and Hama Masius in Ḥāḥayābā, near the river Balikh.¹⁶ He was a student in the convent Tell of Ken neshrē,¹⁷ and on its destruction by fire¹⁸ and the consequent dispersion of the monks, he went to the convent of Mār Jacob at Kaysān, in the district of Samosā.¹⁹ He devoted himself entirely to historical studies,²⁰ which he seems to have carried on in peace and quiet till 818. The patriarch Cyriacus (see above, p. 842) had got entangled in a controversy with the monks of Cyrrhus and Gubbi Barīyā about the words *lāhā shāmāyānā* ("the heavenly bread"), &c., in the Eucharistic service, which ended in the malcontents setting up as anti patriarch Abraham, a monk of the convent of Kartamin. After the death of Cyriacus in 817, a synod was held in June 818 at Callinicus (ar Rakkah), in which, after considerable discussion, Theodore, bishop of Kaysān, proposed the election of Dionysius, which was approved by most of those present, including Basil I, maphrīn of Taghrith.²¹ The poor monk was accordingly fetched to Callinicus, received clerical orders on Friday in the convent of Estīnā or the Pillar, priest's orders on Saturday in the convent of Mār Zakkān or Zaeleus, and was raised to the patriarchate in the cathedral on Sunday the first of Abh, 818, the officiating bishop being Theodosius of Callinicus. Abraham and his partisans, seeing their hopes disappointed, maintained their hostile attitude, which led afterwards to the usual scandalous scenes before the Muslim authorities.²² Immediately after his installation, Dionysius commenced a visitation of his vast diocese, going first northwards to Cyrrhus, thence to Antioch, Kirkisān (Karkisāyā), the district of the Khābūr, Nisibis, Dīrā and Kēphar tūthā, and so back to Callinicus, where he enjoyed the protection of 'Abdallāh ibn Tāhir against his rival Abraham. He did not on this occasion visit Mosul and Taghrith, because the maphrīn Basil thought the times unfavourable.²³ In 825 'Abdallāh ibn Tāhir was sent to Egypt to put down the rebellion of 'Obaidallāh ibn as Sarī, where he remained as governor till 827.²⁴ His brother Muhammad ibn Tāhir was by no means so well disposed towards the Christians, and destroyed all that they had been allowed to build in Edessa.²⁵ Wherefore the patriarch went down into Egypt to beg the omīr 'Abdallāh to write to his brother and bid him moderate his zeal against the church, which he accordingly did.²⁶ On his return from Egypt the patriarch had troubles with Philoxenus, bishop of Nisibis, who espoused the cause of the anti patriarch Abraham,²⁷ and he then went to Baghdad in 829 to confer with the caliph al Ma'mūn as to an edict that he had issued on the occasion of dissensions between the Palestinian and Babylonian Jews regarding the appointment of an exilarch.²⁸ During his stay in the capital disputes took place among the Christians, which ended in a reference to the caliph and in the deposition of the bishop Lazarus bar Sābhēthā.²⁹ From Baghdad Dionysius proceeded to Taghrith and Mosul, and nominated Daniel as maphrīn in place of the deceased Basil. In 830 al Ma'mūn made an attack on the Greek territory, and the patriarch tried to see him on his return at Kaysān, but the caliph had hurried on to Damascus, whither Dionysius followed him and accompanied him to Egypt on a mission to the Bashmuric Copts, who were then in rebellion. Any efforts of his and of the Egyptian patriarch were, however, of no avail, and the unfortunate rebels suffered the last horrors of war.

Genesis survives, though imperfect, in Brit Mus 17274,¹ and there are extracts from them in Paris, Ancien fonds 35 (Zotenberg, *Catal*, p 156), and Bodl Marsh 101 (P Smith, *Catal*, p 462). The Gospels and Pauline epistles (imperfect) are contained in Brit. Mus Add 17274 (Wright, *Catal*, p 620), the latter only in Bodl Or 703 (P Smith, *Catal*, p 410) and Bodl Marsh 86 (*ibid*, p 418). His treatise on the *Hexaëmeron* in five books² is preserved to us in the Paris MS Anc fonds 120 (Zotenberg, *Catal*, p 197), and there are extracts from it in two other MSS (*ibid*, pp 157, 159). The work *De Paradiso*, in three parts, dedicated to his friend Ignatius of Antioch³ is known to us only through the Latin translation of Andreas Masius, 1569.⁴ The treatise on the soul⁵ survives in Cod Vat exlvii (*Catal*, in 273 271), it consists of 40 chapters, with a supplementary chapter to show that the dead are profited by offerings made on their behalf. That on predestination and free will, in four discourses, is extant in Brit Mus Add 14731 (Wright, *Catal*, p 853). The *Inquisitiones against Heresies*, spoken of by Moses's biographer in *BO*, II, 218, col 2, is probably identical with the work *On Sects* mentioned by Assmann at p 131, No 7. The *Festal Homilies* for the whole year⁶ is extant in several MSS, e.g., Brit. Mus Add 21210 (Wright, *Catal*, p 877) and 17188 (*ibid*, p 621), Paris, Anc fonds 35 and 123 (Zotenberg, *Catal*, pp 156, 159). Besides these we have four funeral sermons,⁷ an admonitory discourse to the children of the holy orthodox church,⁸ and a discourse showing why the Messiah is called by various epithets and names.⁹ Moses also wrote expositions of the sacraments of the church, such as on the holy chrism, in 50 chapters, Cod Vat exlvii (*Catal*, in 271) and Paris, Anc fonds 123 (Zotenberg, *Catal*, p 159),¹⁰ with which is connected the discourse on the consecration of the chrism in Brit Mus Add 21210 (Wright, *Catal*, p 879), on baptism, addressed to his friend Ignatius, in 21 chapters, Cod Vat exlvii (*Catal*, in 276), in connexion with which we may take the discourse on the mysteries of baptism in Brit. Mus Add 21210 (Wright, *loc cit*) and on baptism in Cod Vat. exvi (*Catal*, in 522)¹¹, exposition of the liturgy, Brit Mus Add 21210 (Wright, *Catal*, p 879) and Berlin, Sachau 62 (I), further, expositions of the mysteries in the various ordinations, Cod Vat. li (*Catal*, in 320)¹², on the ordination of bishops, priests, and deacons, Brit Mus Add 21210 (Wright, *Catal*, p 879), on the tonsure of monks,¹³ Cod Vat. li (*Catal*, in 322)¹⁴. He also compiled two *synaphorae*¹⁵ one of which has been translated by Renaudot, in 391. Lastly, Moses bar Kephî was the author of a commentary on the *dialectics* of Aristotle, mentioned by Bar Hebraeus in *Chron. Eccles.*, II, 215, and of a commentary on the works of Gregory Nazianzen, and an ecclesiastical history, mentioned by his biographer in *BO*, II, 218, col 2. The loss of this last book is to be regretted.

The contemporary Nestorian writers of mark are hardly more numerous.

In this century the foundations of Syriac lexicography were laid by the famous physician Abū Zaid Honam ibn Ishāk al 'Ibādī of Hīrā (al Hīrāl).¹⁶ He applied himself to medicine at Baghdad, under Yahyā, or Yuhannā, ibn Mūsawāhī (Mūsūyāh or Mesue), but an ill feeling soon sprang up between teacher and pupil, and Honam took his departure for the Grecian territory, where he spent a couple of years in acquainting himself with the Greek language and its scientific literature. He afterwards became physician to the caliph al Mutawakkil. His downfall and excommunication were mainly brought about by a fellow Christian of the same profession, Isr'īl ibn al Tāfīrī, and Honam died soon after, 260 A D = 873 A D.¹⁷ Honam composed most of his original works in Arabic, and likewise many of his translations from the Greek. 'Abd ishō' mentions but three books of his,¹⁸ viz., a book on the fear of God (which he wrote as a deacon of the church), a Syriac grammar, and a compendious Syriac lexicon. The lexicon has no doubt been in great part absorbed into the later works of Bar 'Alī and Bar Balīlūl.¹⁹ The grammar seems to have been entitled *Kṯ thābhā dhē Nukzē*, or the "Book of (Diacritical) Points." It is cited by Bar Hebraeus in the *Isuḡar Rāzē*²⁰ and by Elias of Tīrhūn in his

grammar.²¹ Honam also wrote a treatise *On Synonyms*, whether they be "voces aequivalentes" (as *rēghiz* and *raggiz*) or not (as *ālāthā* and *karyāthā*). Extracts from this work have been preserved to us by a later compiler, who made use also of the canon of 'Anān ishō' of Hēdhayāb²² (see above, p 843). In Cod Vat exvii (*Catal*, in 504) there are excerpts from a medical treatise of Honam, but no title is given.²³ Honam, his son Ishāk, and his nephew Hobaish ibn al Hasan al A'sam ("Stiff wrist") were among the earliest and ablest of those Christians, chiefly Nestorians, who, during the 9th and 10th centuries, making Baghdad their head quarters, supplied Muhammadan scholars with nearly everything that they knew of Greek science, whether medicine, mathematics, or philosophy. As a rule, they translated the Greek first into Syriac and afterwards into Arabic, but their Syriac versions have unfortunately, as it would appear, perished, without exception.

An older contemporary of Honam was Gabriel bar Bōkht ishō', Gal in Arabic Jabra'il ibn Bakhtishū' (or rather Bakhtishū'), a member bar of a family of renowned physicians, beginning with George bar Bō'ī Bōkht ishō' of Gundī-Shābūr, whom we have mentioned above (p 844). He was in practice at Baghdad in 791, and attended on Ja'far ibn Yahyā al Barmakī, became court physician to al Rasūd, and maintained this position, with various vicissitudes, till his death in 828.²⁴ 'Abd ishō' says that he was the author of a Syriac lexicon,²⁵ which is our reason for giving him a place here, but no such work is mentioned by the other authorities to whom we have referred.²⁶

Of Ishō' Marūzayā, in Arabic 'Isā al Marwāzī, from the city of Ishō' Marī or Merv, little is known to us beyond the fact that he com. Marū piled a Syriac lexicon, which was one of the two principal authorities cited in the use of Bar 'Alī.²⁷ That he should be identical with the physician al Marwāzī, who lived about 567,²⁸ seems wholly unlikely. We might rather venture to identify him with Abū Yahyā al Marwāzī, who was an eminent Syrian physician at Baghdad, wrote in Syriac upon logic and other subjects, and was one of the teachers of Mattā ibn Yūnān or Yūnus (who died in 940).²⁹ In any case, 'Isā al Marwāzī seems to have flourished during the latter part of the 9th century, and therefore to have been a contemporary of Bar 'Alī.

Ishō', or 'Isā, bar 'Alī is stated in Cod Vat exvii (*Catal*, in Bar' 504, No xi) to have been a pupil of Honam. His father 'Alī and his uncle 'Isā, the sons of Dāūd or David, were appointed by the catholicos Sabhr ishō' II (832-836) to the charge of the college founded by him in the convent of Mār Pethion at Baghdad.³⁰ Bar 'Alī's lexicon is dedicated to a deacon named Abraham,³¹ who made certain additions to it after the death of the author.³²

Ishō' bar Nūn was a native of the village of Beth Gabbūr near Ishō' Mosul. He was a pupil of Abraham bar Dāshaudīdh (see above, p Nūn 844) at the same time with Abū Nūh al Anbārī (see above, p 845, note 3) and Timothy, his predecessor in the dignity of catholicos (see above, p 846). He retired first to the convent of Mār Abraham on Mount Izlā, where he devoted himself to study and to refuting the views and writings of his schoolfellow and subsequent diocesan Timothy, whom he spitefully called *Tālmēthos* ("the wronger of God") instead of *Timotheos*. In consequence of a dispute with the monks he left Mount Izlā and went for some months to Baghdad, where he stayed at the house of George Mūsawāhī (Mūsūyāh or Mesue) and taught his son Yahyā.³³ He then returned to Mosul, where he took up his residence in the convent of Mār Ehas, and lived there for thirty years, till the death of Timothy.³⁴ Through the influence of Gabriel bar Bōkht ishō' (see above) and his son in law Michael bar Mūsawāhī (Mūsūyāh or Mesue), the physician of the caliph al Ma'mūn, he was appointed catholicos A D 1135.

¹ Ldt. Baethgen, p 82, see Hoffmann, *Opusc. Aest.* p xvi.
² Hoffmann, *Opusc. Aest.* pp 2-49, see *BO*, II, 308 col 2 and Cod Berlin, Sachau 72, No 14. There is also a MS in the collection of the S P C K.

³ Cod Vat. exvii (*Catal*, III 409), *Synagoga Medicorum Syri et Arab.* is not likely to be his, but requires closer examination.

⁴ This is a large subject into which we cannot here enter, the more so as it pertains rather to a history of Arabic than of Syriac literature. We would refer the reader to Wüstenfeld, *Geschichte d. arab. Aerzte u. Naturforscher* 1840 Flügel, *Dissert. de Arabici Scriptorum Graecorum Interpretibus* 1811 Wenrich, *De Auctoribus Graecorum Versionibus et Commentariis* 1842 Runan, *De Philosophia Peripatetica apud Syros*, 1859, sect. viii, p 51, *Al Farabi (Ishfarabius) des Arab. Philosophen Leben u. Schriften* by M. Steinschneider 1869 A Müller, *Die Griechischen Philosophen in der arabischen Uebersetzung*, 1873. Of Muhammadan authorities two of the most important are the *Fihrist* of Abū l Faraj Muhammad ibn Ishāk al Warraq al Baghdadī commonly called Ibn Abi Yn'kib an Nadīm (died early in the 11th century) and the *Uyūn al Anba fī Zakat al Atibā' of Muwaffak ad Dīn Abū l Abbās Ahmad ibn al Kāshim as Sa'di al Khaznaji*, generally known by the name of Ibn Abi Usailah (died in 1260). The former work has been edited by Flügel, J. Rodiger, and A. Müller, 1871-72, the latter by A. Müller 1884.

⁵ See Ibn Abi Usailah, ed Müller, I 127 Wüstenfeld, *Gesch. d. arab. Aerzte*, No 28 Bar Hebraeus *Chron. Syr.* pp 139-140 176 (*BO*, II, 271, note, col 1), and *Hist. Dynast.* 235, 264.

win, brother of Godfrey of Bouillon, took his part. He died of a fall from his horse, shortly after the death of the patriarch in 1129.¹ Though a good scholar and linguist, he does not appear to have written anything that has come down to our times. Assemani, it is true, ascribes to him three poems in twelve syllable metre on the capture of Edessa by Zengi ibn Ak sunkur, but, as this took place in 1144,² the writer must have been his successor, Basil bar Shumna (1143-69).³

John of
Harrân
and
Mardin

John,⁴ bishop of Harrân and Mardô or Mardin, had charge of the Jacobite churches in the East, his diocese including Tell Basmê, Képhar tîthâ, Dârâ, Nisibis, Râs'ain, and the Khâbôrâ or Khâbûr. He was originally a monk of Edessa, was appointed bishop by Athanasius VII in 1125, and was killed by a fall from his horse in 1165, at the age of seventy-eight.⁵ He devoted himself chiefly to the restoration of the decayed churches and monasteries of his diocese, as may be seen from the autobiographical fragment in *BO*, n 217 sq. From the same document, pp 224-225, it appears that he was fond of MSS, which he collected, repaired, and bound, and that he wrote with his own hand four small copies of the Gospels in gold and silver. He enjoyed a well earned reputation as a land surveyor and practical engineer.⁶ Bar-Hebraeus notes his great liberality in redeeming the captive Edessenes who had been carried off by Zengi's troops.⁷ The fall of Edessa (1144), however, was an event that got him into a great deal of trouble. He was ill advised enough to write a treatise on the Providence of God, in which he maintained that chastisements of that kind were not sent upon men by God, and that, if the troops of the Franks (Crusaders) had been there, Edessa would not have been taken by Zengi. Such rank heresy of course brought down upon him the whole bench of bishops. He was attacked by the priest Salihî of Kargûrah (?),⁸ by John bishop of Kâsûm,⁹ John bar Andreas bishop of Mabbôgh,¹⁰ and Dionysius bar Salihî.¹¹ He was also the compiler of an anaphora.¹²

Jacob or
Dionysius bar
Salihî

The star of this century among the Jacobites is undoubtedly Jacob bar Salihî of Melitene (Malatiah). He was created bishop of Mar'ash, under the name of Dionysius, by Athanasius VIII (Yeshû' bar Ketrâh, 1138-66), in 1145, and the diocese of Mabbôgh was also placed under his charge.¹³ Michael I (1166-99) transferred him to Amid, where he died in 1171.¹⁴ The list of his works, as quoted by Assemani from a Syriac MS, is very considerable,¹⁵ and he has dealt with them at great length.¹⁶ We may mention the following: (1) Commentary on the Old Testament, of which only one complete MS exists in Europe.¹⁷ The order of the books is—the Pentateuch, Job, Joshua, Judges, Samuel and Kings, Psalms, Proverbs, Ecclesiastes, the Song of Songs, Isaiah, Jeremiah and Lamentations, Ezekiel, Daniel, the twelve minor Prophets, and Ecclesiasticus. Each book has a material or literal and a spiritual or mystical commentary. Several of the books have two commentaries, one on the Peshittâ, the other on the Hexaplar text, Jeremiah has actually three, one on the Hexaplar, and two, a shorter and a longer, on the Peshittâ. (2) Commentary on the New Testament, from which Assemani has given many extracts.¹⁸ The order of the books is—the four Gospels, the Revelation of St John, the Acts of the Apostles, the seven apostolic epistles, and the fourteen epistles of St Paul.¹⁹ (3) A compendium of theology, of which we do not seem to have any MS in Europe, see *BO*, n 163, col 1, ll 13-15, and p 170. (4) A copious treatise against heresies, dealing with the Muhammadans, the Jews, the Nestorians, the Dyophysites or supporters of the council of Chalcedon, and the Armenians.²⁰ (5) A treatise on the Providence of God, against

John, bishop of Mardin,²¹ apparently no longer extant. (6) Expositions of the Eucharistic service,²² of the Nicene creed,²³ of the consecration of the chrism,²⁴ of the services of consecration,²⁵ and of the Jacobite confession of faith.²⁶ (7) Canons on confession and absolution.²⁷ (8) Two anaphorae or liturgies.²⁸ (9) Various prayers, proœmia, and sedrâs.²⁹ (10) Homilies, e.g., enœmion on the patriarch Michael the Elder,³⁰ on the Passion of our Lord,³¹ and on withholding the sacrament from those who abstain from communicating for a period of more than forty days.³² (11) A commentary on the six Centuries of Evagrius.³³ (12) Two poems on the fall of Edessa (1144),³⁴ three on the fall of Mar'ash (1156),³⁵ and two on another incident (1159).³⁶ Among the works mentioned in the list in *BO*, n 210-211, we cannot find any traces of the *Commentarius in Scripta Doctorum*, the *Compendium Historiarum Patrum et Sanctorum et Martyrum*, and the *Compendium Canonum Apostolicorum*, nor of the commentaries on the books of *Dialectics*, *ibid*, col 1. Of the epistles two are extant in Arabic, Berlin, Sachau 61, 1, 2. From a treatise *On the Structure of Man* there are two short extracts in Bodl Marsh 361, f 39. Dionysius appears also to have revised the Jacobite order of baptism,³⁷ and to have drawn up a volume of services for the days of the week.³⁸

Michael the Elder,³⁹ the son of Elias, a priest of Melitene, of the Michael family of Kindasî,⁴⁰ was abbot of the convent of Bar saumî, near Melitene,⁴¹ which we find him supplying with water, with the help of John, bishop of Mardin, in 1163.⁴² He was elected patriarch in 1166, and held office till 1199.⁴³ He revised the Jacobite pontifical and ritual, arranging its contents under forty-six heads, as exhibited in Cod Vat li,⁴⁴ drew up an anaphora,⁴⁵ wrote a tract setting forth the Jacobite confession of faith,⁴⁶ a treatise against a Coptic schismatic, Mark the son of Koubir, on the question of confession,⁴⁷ and a poem on a case of persecution in 1159.⁴⁸ He also revised in 1185 the life of Abihai, bishop of Nisaea, having found most copies of it in a very disordered state.⁴⁹ His most important work was a *Chronicle*, from the creation to 1196 AD, which was translated, with other works of his, into Armenian, and apparently exists in that language alone.⁵⁰ Some extracts from it were published by Delaurier in the *Journal Asiatique* for 1848, p 281 sq, and 1849, p 315 sq, and the whole has been edited in a French translation by V Langlois, *Chronique de Michel le Grand*, 1868. According to him the translator of the first part of the work was the vartabed David, and it was finished by the priest Isaac, who completed his task in 1248, continuing it down to his own day. A third person engaged in translating the works of Michael into Armenian was the vartabed Vartan.⁵¹ Appended to the *Chronicle* is an extract from a treatise of his "On the Sacerdotal Order and its Origin," or "On the Origin of Sacerdotal Institutions," with a continuation by Isaac and Vartan,⁵² which is followed in the MSS by the Jacobite "confession of faith."⁵³ Michael appears also to

⁴⁰ Bar Hebraeus, *Chron. Eccles.*, i 537. ⁴¹ Assemani expressly says "at Shennâ (ܫܢܐ) *BO*, n 104 but the list

of patriarchs at p 323 does not give the word ܫܢܐ, though he repeats it in the translation (no 100). In the *Dissert de Monophysites* p xcvii, he makes Michael belong to the convent near Melitene and merely mentions another convent of Bar saumî nt. "Sena (see also the Index, p 53). Langlois in the preface to the *Chronique de Michel le Grand* p 7 thinks of a convent near Mardin, such as that restored by John, bishop of Mardin (*BO*, n 222, 1 10). We believe, however, that the convent near Melitene is meant, as John of Mardin had acquired a certain reputation in what Abbé de la Motte calls the "ars grammatica" (Bar Hebraeus, *Chron. Eccles.*, i 536, note 1), wherefore it is said that Michael sent for him (shaddar bathra), and that John "returned to his diocese because" the winter was at hand, meaning to come back in April" (p 527).

Revelation, &c., Brit. Mus. Add. 7183, Bodl Or 500. Dudley Loftus was the first to make use of these commentaries in his two works, *The Exposition of Dionysius Syrus written above 600 years since*, on the *Frangelist St Mark*, translated by D. L. (Dublin, 1672), and *A Clear and Learned Explication of the History of our Blessed Saviour J. C.* by Dionysius Syrus, translated by D. L. (Dublin, 1695). See Payne Smith, *Catal*, p. 411, notes d and f. Loftus's manuscript translations are in the Bodleian Library, Fell 6 and 7.

¹⁹ *BO*, n 170-211. The section against the Muhammadans is contained in Cod Vat. xvi 19, and that against the Nestorians in Paris, Anc. fonds 125 (Zotenberg, *Catal*, No 209, 2). There is an extract from the latter in Bodl

in 1231 and died in 1211,¹ on his way to visit the aged patriarch Ignatius II (maphriān 1215-22, patriarch 1222-53). He possessed a great many books, which were all conveyed to the *dimosion*² of the ruler of Mosul. His works are as follows: (1) *The Book of Treasures*, a theological treatise in four parts, viz., part 1, of the three one God, part 2, of the incarnation of the Son of God, part 3, of the Divine Providence, part 4, of the creation of the universe, the angels, the different kinds of life, the soul of man, the resurrection, and the last judgement.³ (2) *The Dialogues*, in two books. Book 1, dial 1, on grammar, followed by a discourse on the same in twelve syllable metre, dial 2, on rhetoric, dial 3, on the art of poetry or metres, dial 4, on the eloquence and copiousness of the Syriac language. Book 2, dial 1, on logic and the syllogism, dial 2, on philosophy, its kinds, divisions, and subdivisions, in five sections, viz., (a) on the definitions of philosophy, its divisions, &c. (b) on the philosophic life and conduct, (c) on physics or physiology, (d) on the four disciplines,—arithmetic, music, geometry, and mathematics, (e) on metaphysics and theology.⁴ Of his letters two are extant, in verse, addressed to Takhl ad Daulah Mark bar Thomas and his brother Tū ad Daulah Abū Tihir Sūd.⁵ He also wrote a confession of faith regarding the Trinity and the incarnation, which he himself cites in the *Book of Treasures*, part 2, chap 14, and an exposition of the services and prayers of the church, which is referred to in the same work, part 2, chap 31 (on the addition of the words "who was crucified for us" to the Trisagion).⁶ Under the name of Israh of Manpukat we have an admonition addressed to persons seeking ordination as priests, which is found in many service books.⁷

Aaron
bar
Ma'dani

Aaron bar Ma'dani (or Ma'dānī) had been recently appointed bishop of Mardin, under the name of John, when he was promoted by the patriarch Ignatius II to the dignity of maphriān in 1232.⁸ His bodily presence seems to have been somewhat insignificant, and he was no orator, for which reasons he was unpopular.⁹ In 1237 he went to Baghdad, where in the following year he composed his panegyric on the holy Mār Aaron, and ingratiated himself with the three brothers Shams ad Daulah, Fakhr ad Daulah, and Tū ad Daulah, the sons of the archbishop Thomas, who were in high favour at the court of al-Mustansir bi'l-lāh. He learned to speak and write Arabic thoroughly.¹⁰ In 1244 he was recalled to Mosul and received with every mark of respect.¹¹ On the death of Ignatius in 1252, Dionysius (Aaron 'Angūr) was created patriarch,¹² but a rival faction set up John bar Ma'dani,¹³ and so the two ruled in a divided church till Dionysius was murdered in the convent of Bar Saumū near Melitene in 1261,¹⁴ after which time his rival sat alone till 1263.¹⁵ John bar Ma'dani compiled an anaphora¹⁶ and wrote a great many poems, of which Bodl. Hant. 1 contains no less than 60.¹⁷ Some of the more important of these are the poem on the soul, entitled 'the Bird' (*Pānīkīlā*),¹⁸ on the high origin of the soul and its degradation by sin,¹⁹ on the excellent path of the perfect,²⁰ and on the capture of Edessa and other places by the Seljuk sultan 'Alī u d dīn Kākubīdī in 1235.²¹ Of his homilies Cod Vat. 2511 contains eighteen for various feasts in Arabic.²²

Bar
Hebraeus

These writers are, however, all cast into the shade by the imposing figure of Bar Hebraeus, as we are accustomed to call him, one of the most learned and versatile men that Syria ever produced.²³ Abū 'l-Fary Gregory²⁴ was the child of a physician at Melitene (Malatya) named Aaron, a convert from Judaism or of Jewish descent, whence his son got the name of Bar 'Ebhriyā or Ibn al-

Ibri, "the son of the Hebrew." He was born in 1226,²⁵ and devoted himself from his boyhood to the acquisition of Greek and Arabic. A little later he applied himself also to theology and philosophy, besides practising medicine under his father and other distinguished physicians. His lot was cast, however, in evil days. In 1243 many of the inhabitants of Malatya fled to Aleppo before the advancing hordes of Hulagū and his Tatars, and his father would have been among the fugitives, had it not been for a lucky accident.²⁶ In the following year his father had actually to attend as physician upon one of the Tatar generals, whom he accompanied to Khirtabart, and on his return retired almost immediately from Malatya to the safer city of Antioch.²⁷ Here Bar Hebraeus completed his studies and commenced his monastic life.²⁸ Thence he went to Tripolis, where he and Sahbhā bar Jacob Waghī, of Edessa, were studying medicine and rhetoric with a Nestorian teacher named Jacob, when they were summoned before the patriarch Ignatius II, on 14th September 1246, and ordained bishops, the former of Gūbīs (Gūbis) near Malatya, the latter of 'Akkō.²⁹ Bar Hebraeus was then just twenty years of age. In the following year he was transferred to Lakhbiān, another diocese adjacent to Malatya,³⁰ by the patriarch Ignatius.³¹ After the death of Ignatius, Bar Hebraeus took the part of Dionysius (Aaron 'Angūr) against John bar Ma'dani, and was transferred by him in 1253 to Aleppo,³² but quickly deposed by his old friend Sahbhā (who sided with John bar Ma'dani),³³ nor did he recover this see till 1258.³⁴ The next patriarch, Ignatius III (Yūshū), abbot of Gōlikh near Mops estia,³⁵ advanced him to the dignity of maphriān in 1264.³⁶ Henceforth his life was an active and busy one, and it seems almost marvellous that he should have studied and written so much, while in no way neglectful of the vast diocese committed to his charge. The story is told by himself in simple language in his *Ecclesiastical History*,³⁷ with a continuation by his surviving brother Bar Saumū Sufī, giving a nearly complete list of his works.³⁸ He died at Marāghāh in Aḥmādīyā on 30th July 1286, and the greatest respect was shown to his memory by Greeks, Armenians, and Nestorians alike, the shops being closed and no business transacted.³⁹ His body was conveyed to the convent of Mār Matthew at Mosul,⁴⁰ where his grave was seen by Badger in October 1843.⁴¹ Bar Hebraeus cultivated nearly every branch of science that was in vogue in his time, his object being on the one hand to reinvigorate and keep alive the Syriac language and literature, and on the other to make available to his co-religionists the learning of the Muhammadans in a suitable form. Hence his treatment of the Aristotelian philosophy, following in the footsteps of Ibn Sīnī (Avicenna) and other Arabian writers.⁴² The *Kithābhā dhī Dhā bhāthā*, or "Book of the Pupils of the Eyes," is a compendium of the art of logic or dialectics, comprising an introduction on the utility of logic and seven chapters in which the author deals successively with the *Isagōgē* of Porphyry, the *Categories*, *De Interpretatione*, *Analytica Priora*, *Topica*, *Analytica Posteriora*, and *De Sophisticis Elenchis*.⁴³ In connexion with it we take the *Kithābhā dha Sūcādīh Sophia* or "Book of the Speech of Wisdom," a compendium of dialectics, physics, and metaphysics or theology.⁴⁴ The large encyclopaedia entitled *Ḥikmah Ḥikmah*, "Butyrum Sapientia," or less correctly *Ḥikmah Ḥikmah*, "Sapientia Sapientiarum," comprises the whole Aristotelian discipline. The first volume contains the *Logic*, viz., the *Isagōgē*, *Categories*, *De Interpretatione*, *Anal. Pri* and *Posterior*, *Dialectica*, *De Sophisticis Elenchis*, *Rhetoric*, and *Art of Poetry*. The second comprises the *Physics*, viz., *De Anaxilli Physica*, *De Caelo et Mundo*, *De Meteoris*, *De Generatione et Corruptione*, *De Fossilibus*, *De Plantis*, *De Animalibus*, and *De Anima*. The third, in its first section, treats of the *Metaphysics*, viz., of the origin and writers of philosophy, and of theology in its second section, of ethics, economics, and politics.⁴⁵ An abridge-

¹ Assmann (*B.O.*, II 45) is mistaken: see also pp. 237 and 477.

ghah, he undertook to make a recension in Arabic of the political history, which he all but finished within the space of one month before his last illness came on.¹ This edition is enriched with many references to Muhammadan writers and literature which are wanting in the Syriac. It is entitled *al Mulhiyar fi'd Duwal*, or "Compendious History of the Dynasties."² As a poet Bar Hebraeus is admired by his countrymen, and even Renan has thought the poem on the theme *Bona Lex sed Melior Philosophia* to be worthy of publication.³ Some of the poems were badly edited and translated by Von Lengerke in 1836-38 according to the Paris MS. Ancien fonds 130, others have been published by the Maronite priest Augustinus

Seebābi (الشبابي) at Rome, 1877. The *Carmen de Divina Sapientia* was brought out so long ago as 1638 by Gabriel Sionita, and has been republished at Rome in 1880 by Yohannā Notayn

Darūm (يوحنا نطین الدرعي).⁴ In his youth Bar-Hebraeus wrote a book on the interpretation of dreams, *pushshāk helmā*,⁵ and in his later years he made a collection of entertaining and humorous stories in Syriac, entitled *Kēthābhā dhē Thunnāwē Mēghahhēkhānū*, with an

Arabic counterpart under the title of *Daf' al Hamam* (دفع الحمام),

"the Driving away of Care."⁶ The contents of the *Thunnāwē* are, however, more varied than the title seems to promise, as may be seen from Assemani's enumeration of the chapters, *BO*, II, 306.⁷

Daniel bar Khatfāb Contemporary with Bar Hebraeus, though somewhat younger, we may place Daniel bar Khatfāb, to whom Assemani has devoted two articles in the *BO*, II, at pp. 244 and 463. Among the poems of Bar-Hebraeus we find verses addressed to this Daniel by the Nestorian Khamis bar Kardāh with his reply and another by Bar Hebraeus.⁸ He composed abridgements in Arabic of several of Bar Hebraeus's works, e.g., the *Nomocanon*,⁹ *Ethica*, *Ansar Rāz*, *Mūnārath Kudh shē*, *Kēthābhā dhē Bhābhāthā*, and the larger grammar.¹⁰ An independent work of his, also in Arabic, treats of *The Bases, or First Principles of the Faith and Consolation of the Hearts of Believers*.¹¹

With Daniel bar Khatfāb we may close our list of Jacobite writers in the literature of Syria. The Nestorians kept the lamp burning for a little, though not much longer, as we shall presently see.

Solomon of al-Basrah Shikmōn, or Solomon, of Khilāt or Akhlāt, on the shores of Lake Van, was present as metropolitan of Pērath dē Maishin or al-Basrah at the consecration of the catholicos Sabhrishō in 1222.¹² Besides some prayers and short discourses (*māmūrāt*), he wrote a treatise on the figure of the heavens and the earth,¹³ and compiled a volume of anecdotes, partly theological, partly historical, which he entitled *Kēthābhā dhē Dhebbōrithā* or "the Bee." It is dedicated to his friend Narsai, bishop of Khōnī Shībhor or Bēth Wāzih, called by the Arabs al-Bawāzigh or al-Bawāzī, on the lesser Zab. Of this work an analysis has been given by Assemani in the *BO*, III, 309-324, and there is a German translation of it by Schönfelder, 1866. It has been recently edited by Mr E. A. W. Budge, of the British Museum, with an English translation, Oxford, 1886.¹⁴

George Wardā This was an age of song with the Nestorians, in which lived some of their favourite writers of hymns. (1) One of the most conspicuous of these is George Wardā (the Rose) of Arbēl or Irbil, whose poems have entered so largely into the use of the Nestorian Church that one of their service books is to this day called the *Wardā*.¹⁵ His date may be gathered from certain of his hymns, which speak of the calamities of the years 1535-38=1224-27 A.D.¹⁶ (2) About the same time flourished Mas'ūd of the family Bēth Kashshā (in Arabic Ibn al-Kass), who was physician (*hakīm*) to the caliph al-Musta'sim (1242-58), and outlived his patron.¹⁷ One of his poems

for the feast of the Epiphany occurs in Cod. Vat. clxxxiv (*Catal* III, p. 389).¹⁸ (3) Khamis bar Kardāh of Arbēl was a younger contemporary of Bar Hebraeus, as appears from his correspondence *Khamis* with Daniel bar Khatfāb (see above). He too has bequeathed his name to one of the Nestorian service books, which is still called Gabriel the *Khamis*.¹⁹ (4) Gabriel Kamsā (the Loenst) was a monk of Bēth Kamsā Kūlkā. He became metropolitan of Mosul, and was present at the consecration of Yabhi alāhā III in 1281.²⁰ There is a long poem of his in Cod. Vat. clxxxv (*Catal*, III, 376), treating of the creation, the incarnation, the life of our Saviour, the preaching of the apostles, and the praises of the fathers of the church, and concluding with an eucologium on Sabhrishō, the founder of Bēth Kūlkā. (5) John John of Mosul was a monk of the convent of St Michael near that city.²¹ His work entitled *Kēthābhā dhē Shappir Dubbārē* was published at Rome in 1868 by E. J. Millos, archbishop of Akk, as a school-book, under the title of *Directorium Spirituale*. It is, of course, impossible to say to what extent the original has been tampered with in such an edition, but there is a MS. in the Brit. Mus. Or. 2450.²² The composition of the work is placed by Millos in 1245, and the death of the author by Cardāhi (*Liber Theauri*, p. 120) in 1270.

'Abhdishō bar Bēnkāh holds nearly the same position in regard 'Abhdishō to the Nestorian Church that Bar Hebraeus does in relation to the Ishō bar Jacobite, though far inferior in talent and learning to "the Son of Berikha, the Hebrew." He flourished under Yabhi alāhā III, being firstly bishop of Sluggār (Sinjar) and Bēth 'Arbāc about 1285,²³ and afterwards, before 1291,²⁴ metropolitan of Nisibis and Armenia. He died in 1318.²⁵ He has left us a list of his own publications at the end of the *Catalogus Librorum*, in the *BO*, III, 325-27. Several of these seem to be lost,—at least they do not appear in the catalogues of our collections,—such as the commentary on the Old and New Testaments,²⁶ the *Kēthābhā Katholika* on the various lessons dispensation or life of our Lord on earth,²⁷ the *Kēthābhā Skolastika* against all the heresies,²⁸ the book of the mysteries of the Greek philosophers,²⁹ the twelve discourses comprising all the sciences,³⁰ and the ecclesiastical decisions and canon,³¹ as also an Arabic work with the title *Shah marwārid* or "the King's pearl."³² The *Mar gānithā* or "Pearl" is a theological work in five sections, treating of God, the creation, the Christian dispensation, the sacraments of the church, and the things that prefigure the world to come. There is a careful analysis of its contents in *BO*, III, 352-360. It has been edited, with a Latin translation, in Mai, *Scripta Felt Nova Coll.*, I, 350-359. The date of composition is 1298.³³ 'Abhdishō himself translated this work into Arabic in 1312, as we learn from 'Amr ibn Mattā in the *Maydal*, where large portions of it are quoted.³⁴ The *Collection of Synodical Canons or Nomocanon* is also fully analysed by Assemani, *BO*, III, 332-351. It has been edited, with a Latin translation, in Mai, *Scripta Felt Nova Coll.*, I, 359-360. As a poet 'Abhdishō does not shine according to our ideas, although his countrymen admire his verses greatly. Not only is he obscure in vocabulary and style, but he has adopted and even exaggerated all the worst faults of Arabic writers of rhimed prose and scribbles of verse.³⁵ His principal effort in poetry is the *Paradise of Eden*, a collection of fifty poems on theological subjects, which has been analysed by Assemani, *BO*, III, 332-332. This volume was published by the author in 1291, and in 1316 he found that it was necessary to add an explanatory commentary.³⁶ Another collection of twenty-two poems, which may be regarded as parts of one composition, treating of the love of wisdom and knowledge, is found in Cod. Vat. clxxxv (*Catal*, III, 359) and Bodl. Marsh. 201 (P. Smith, *Catal*, p. 510), and a third, including the above and a selection from the *Paradise*, is contained in Bodl. Marsh., 361.³⁷ Of his minor works, enumerated in the *BO*, III, 361, the epistolary discourses, the letters, and the commentary on the epistle of Aristotle to Alexander concerning the great art (alchemy) seem

⁴⁰ Payne Smith *Catal*, p. 523. See also p. 531, No. 20-31. In Paris, Anc. fonds 104, there is a poem explanatory of the ecclesiastical calendar (*Zotabary*, *Catal*, p. 125).

ment of this large work is the *Tegērāth Tegērāthā* or "Mercatura Mercaturarum," which goes over the same ground in briefer terms.¹ To this class too belongs a poem "On the Soul, according to the views of the Peripatetics," which is described as "mēmā shūnūyā," i. e., according to Assemani, riming in the letter *sh*.² Bar Hebraeus also translated into Syriac Ibn Sīnā's *Kitāb al-īshārāt wa 'l-tanbīhāt*,³ under the title of *Kēthābhā dhē Rem-zā wa Mē'u ānwāthā*,⁴ and another work of the same class, entitled *Zubdal al Asār* or "the Cream of Secrets," by his elder contemporary, Athar ad din Mufaddal ibn 'Omar al Abharī (died in 1262).⁵ Nor did he neglect the study of mathematics and astronomy. In 1268 we find him lecturing on Euclid in the new convent at Marāghah, and again in 1272, at the same place, on the *Megistē* ("Ἡ μεγάλη συντάξις") of Ptolemy.⁶ He drew up a *zygē*, i. e., a set of astronomical tables or astronomical almanac, for the use of tirots,⁷ but his principal work in this branch of science is the *Sullā'ā Hawnānāyā* or "Ascent of the Mind," a complete treatise on astronomy and cosmography, which he composed in 1279.⁸ His medical writings are more numerous, for Bar Hebraeus was famous as a physician⁹ and had been in attendance as such on the Tatar "king of kings" in 1263.¹⁰ He made, for example, a translation and an abridgement of Dioscorides's treatise *Ἐπεὶ τῶν ἰατρικῶν* (De Medicamentis Simplicibus), under the title of *Kēthābhā dhē Dhokoridhis*,¹¹ and wrote a commentary on the *Aphorisms* of Hippocrates in Arabic,¹² and on the *Questions Medicæ* of Honan ibn Ishāk in Syriac.¹³ He also published the *Questions* in an abridged Syriac translation.¹⁴ Further, he is said to have written commentaries on Galen's treatises *De Elementis* (Ἐπεὶ τῶν καθ' ἱπποκράτην στοιχείων) and *De Temperamentis* (Ἐπεὶ τῶν κρᾶσεων).¹⁵ He made an abridged version in Arabic of al Ghāhki's¹⁶ "Book of Simples" (*al-adwiyah al mufradah*),¹⁷ and left an unfinished Syriac translation of the Canon (*al Kanūn fi 'l Tibb*) of Ibn Sīnā.¹⁸ A large medical treatise of his own composition in Syriac is mentioned, but no special title is given.¹⁹ As a grammarian Bar Hebraeus deserved well of his country, and his writings on this subject are now well known and appreciated by Orientalists. By making use of the work of previous grammarians, especially Jacob of Edessa, he has succeeded in giving a very full sketch of the language according to the Oriental system, with many valuable observations as to dialectic differences, &c. The larger grammar bears the title of *Kēthābhā dhē Semhē*, "the Book of Lights," or "Rays."²⁰ It has been published, according to the Paris MS. Ancien fonds 166, by the Abbe Martin.²¹ The smaller metrical grammar, *Kēthābhā dhē Ghrammahī*,²² was edited so long ago as 1843 by Professor Bertheau of Göttingen, according to the MS. Orient. 18 in the library of that university, but without the fifth section *De Vocibus Æquivocis*. Martin has republished it in his *Œuvres Grammaticales d'Abou 'l Faraj*, vol. II, including the fifth section, according to the Paris MS. Ancien fonds 167.²³ A third, still smaller grammar, *Kēthābhā dha Dhēlū ihā* or "the Book of the Spark," was left unfinished by the author.²⁴ As a theologian, Bar Hebraeus's most useful work undeniably is the *Aṣgar Rāz* or "Storehouse of Secrets, the *Horreum Mysteriorum* as it is commonly called.²⁵ This is a critical and doctrinal commentary on the text of the Scriptures of the Old and New Testaments, based on the Peshittā, but taking note of the various readings of the Hebrew text, the LXX and other Greek versions, the later Syriac translations, and even the Armenian and Coptic, besides noting differences of reading between the Nestorians and Jacobites. The doctrinal portion is drawn from the Greek fathers and previous Syriac theologians, of course of the Monophysite school.²⁶ The *Mēnarath Kudhshē*, or "Lamp of

the Sanctuary," is a treatise on the "bases" or first principles on which the church is established.²⁷ It deals in twelve "bases" with the following subjects—(1) of knowledge in general, (2) of the nature of the universe, (3) of theology, (4) of the incarnation, (5) of the knowledge of celestial substances, i. e., the angels, (6) of the earthly priesthood, (7) of the evil spirits, (8) of the rational soul, (9) of free will and liberty, fate and destiny, (10) of the resurrection, (11) of the end of the world and the last judgement, (12) of paradise. The *Kēthābhā dhē Zalḡ*, or "Book of Rays," is a compendium of theology, going over nearly the same ground as the previous work, in ten sections.²⁸ The *Kēthābhā dhē Ithkōw*, or *Liber τῶν ἠθικῶν*, was composed at Marāghah in 1279. It has been fully analysed by Assemani in the *BO*, II 303 sq. Part I treats of the exercises of the body and mind, such as prayer, manual work, study, vigils, fasting, &c., part II, of the regimen of the body, part III, of the purifying of the soul from evil passions, part IV, of the adorning of the soul with virtues.²⁹ The *Kēthābhā dhē Yauwā*, or "Book of the Dove," is a similar work specially intended for the use of ascetics living in solitude as hermits.³⁰ It is also divided into four parts, viz., (1) of the training of the body, i. e., in alienation from the world, repentance, poverty, humility, patience, fraternal love, &c., (2) of the training of the soul, i. e., in quiet, religious exercises, prayer, watching, fasting, &c., (3) of the spiritual rest of the perfect, and (4) an autobiographical sketch of his own spiritual life.³¹ Bar Hebraeus also spent part of his time in excerpting, arranging, and commenting upon the *Book of Hierotheus concerning the hidden Mysteries of the House of God*.³² In the commentary he chiefly follows that of Theodosius, patriarch of Antioch (see above, p. 816).³³ He compiled an anaphora,³⁴ published a confession of faith or creed,³⁵ and approved the order of baptism of Severus, as translated by Jacob of Edessa.³⁶ More valuable than these is his *Kēthābhā dhē Hudlayē*, "the Book of Directions" or "Nomocanon," which is for the Jacobite Church what the *Kannāshā dhē Kānōn* of 'Abhd ishō' is for the Nestorian, both in ecclesiastical and secular matters.³⁷ To us Europeans the historical writings of Bar Hebraeus surpass in interest and value everything else that he has written. He planned and executed a *Universal History* in three parts.³⁸ Part I contains the political *History of the World* from the creation down to his own times.³⁹ Part II is the history of the church from Aaron downwards, the treatment being exceedingly brief till we reach the post apostolic period, when it becomes a history of the patriarchs of the church of Antioch, and finally, after the age of Severus, of the patriarchs of the Monophysite branch of that church down to the year 1285. The meagre continuation by a later hand reaches to 1495. Part III offers us the history of the Eastern division of the Syrian Church from St. Thomas the apostle onwards. From the time of Maruthā (629) it becomes the history of the Monophysite maphrians of Taghrith, though a record is always carefully kept of the catholic patriarchs of the Nestorians. It closes with the year 1286, but there is a continuation by Bar Hebraeus's brother Bar saumū to 1288, and thence by another writer to 1496.⁴⁰ In the last years of his life, at the request of some Muslim friends in Marā

this work.—Cod. Vat. clxxx, cclxxxii. Palat. Medic. cxvi. Bodl. Hunt 1 Brit. Mus. Add. 7185, 21.50, 22.96, Berlin, Alt. Best. 11, Sachau 134, Göttingen, Orient. 18a. Cambridge, coll. of the S. P. C. K.

²⁷ *BO*, II 284. MSS.—Cod. Vat. clxxxiii. Paris, Anc. fonds 121, Cambridge, coll. of the S. P. C. K. This work has been translated into Arabic.—Paris, Anc. fonds 128, Brit. Mus. 18290. Bodl. Hunt 48, Berlin, Sachau 81. Cambridge, coll. of the S. P. C. K. Mr. R. J. H. Gottheil has recently lithographed, "for private circulation only," a small portion of this work viz., book II, ch. III, sect. 3, paragr. b, on plants (20 pp. of text, 4 pp. of preface). The title is *A list of Plants and their Properties from the Mēnarath Kudhshē of Gregorius bar 'Ebrayā* edited by Richard J. H. Gottheil, p. 4.

²⁸ *BO*, II 297. MSS.—Cod. Vat. clxxx. Bodl. Or 467, Hunt 521. Paris, Anc. fonds 129, Suppl. 69, Brit. Mus. Or 1017, Berlin Sachau 8, Cambridge, coll. of the S. P. C. K.

²⁹ MSS.—Cod. Vat. clxxi, Bodl. Marsh 181, Hunt 490. Brit. Mus. Add. 7104, 7105, Paris, Anc. fonds 122. Suppl. 75. There are two Arabic translations of this work see Zotenberg, *Catal.*, p. 201, No. 247.

³⁰ Bodl. Hunt 1, Cambridge, coll. of the S. P. C. K. There is an Arabic translation, Paris, Anc. fonds 126, 145 (ff. 292-299).

³¹ Probably a production of Stephen bar Sūdh nīlē see Brit. Mus. Add. 7186, where we have the commentary of Theodosius, patriarch of Antioch, and compare Frothingham, *Stephen bar Sūdānī*, p. 87 sq. See also above, p. 432.

³² Brit. Mus. Or 1017. Other MSS.—Paris, Anc. fonds 138. Berlin, Sachau 206. The work seems to have been translated into Arabic (see Zatuaberg, *Catal.*, p. 176).

³³ See Cod. Vat. III. Paris, Anc. fonds 67. Medic. Palat. xlii. *BO*, II 299. Rendered into Latin by J. A. Assemani in *Mini. Scripti i. el. Nova Coll.*, x. MSS.—Cod. Vat. cxviii, ccvii, vii, cclviii, ix. Bodl. Hunt 1. Paris, Anc. fonds 140, Berlin, Alt. Best. 40. Palat. Medic. lxi. It has been translated into Arabic.

³⁴ This has been edited under the title of *Bar Hebraeus Chronicon Syriacum* by Bruns and Kirsch, with a Latin translation, in two volumes 1769. Both text and translation are equally bad and the work deserves a new edition.

³⁵ Parts II and III which supplied Assemani with the greatest part of the materials for the second volume of his *Bibl. Orientalis*, have been edited by Abboud and Lamy in three volumes, viz., part II in two volumes, 1872-74, and part III in one volume, 1877, accompanied by a Latin translation and notes. It might be advantageously reprinted, if revised by a competent hand. MSS of the entire history are—Cod. Vat. clxxvi, cclxxxiii, viii. Bodl. Hunt 1. Palat. Medic. cxviii. Part I is contained in Cod. Vat. clxxviii and Bodl. Hunt 62. parts II and III in Brit. Mus. Add. 7188 and Cambridge Dd 3. 8, 1, as also in the coll. of the S. P. C. K. Whether the Berlin MS, Sachau 210, contains the entire work, or only a part of it we do not know. It is simply described as "Chronik des Bar Hebraeus." There are excerpts in Cod. Vat. clxxxiii.

¹⁷ *Œuvres Grammaticales d'Abou 'l Faraj*, vol. I, 1872. The chapter on the signs of interpolation &c., was edited by Dr. Phillips in 1869, in a letter by Mar Jacob, Bishop of Edessa, on Syriac Orthography. MSS. of this work are—Cod. Vat. cccxvi, cccxxii. Bodl. Hunt. 1, Pocock 298. Paris, Anc. fonds 166. Brit. Mus. Add. 7201. Palat. Medic. cxlii, Göttingen, Or 15b. Berlin, Alt. Best. 43, Sachau 307, 308. Cambridge, coll. of the S. P. C. K.

¹⁸ *BO*, II 308.

¹⁹ Of this work there are many MSS. in Europe, differing from one another in the quantity of the scholia and the retention or omission of section 5.

²⁰ *BO*, II 272. No. 27.

²¹ *Ibid.*, II 277.

²² Portions of this work have been edited at various times, but a complete edition is still unachieved. Lamsaw made a very small beginning in 1838. See the list in Nestle's *Brevi Linguae Syr. Grammatica*, 1881, pp. 81-82. MSS. of

ghah, he undertook to make a recension in Arabic of the political history, which he all but finished within the space of one month before his last illness came on.¹ This edition is enriched with many references to Muhammadan writers and literature which are wanting in the Syriac. It is entitled *al Muhtasar fi 'd Duwal*, or "Compendious History of the Dynasties."² As a poet Bar Hebraeus is admired by his countrymen, and even Renan has thought the poem on the theme *Bona Lex sed Melior Philosophia* to be worthy of publication.³ Some of the poems were badly edited and translated by Von Lengerke in 1836-38 according to the Paris MS. Ancient fests 130, others have been published by the Maronite priest Augustinus

Seebibi (الشَّابِّي) at Rome, 1877. The *Carmen de Divina Sapientia* was brought out so long ago as 1638 by Gabriel Sionita, and has been republished at Rome in 1880 by Yohannu Notayn

Darannu (يُوحَنَّا نَطِين الدَّرْعَوِي).⁴ In his youth Bar Hebraeus wrote a book on the interpretation of dreams, *nushshāh helmā*,⁵ and in his later years he made a collection of entertaining and humorous stories in Syriac, entitled *Kethābhā dhē Thummayc Mēghalikhē hānē*, with an

Arabic counterpart under the title of *Daf' al Hamm* (دَفْعُ الْهَمِّ), "the Driving away of Care."⁶ The contents of the *Thummayc* are, however, more varied than the title seems to promise, as may be seen from Assemani's enumeration of the chapters, *B O*, ii 306.⁷

Daniel
bar
Khattāb Contemporary with Bar Hebraeus, though somewhat younger, we may place Daniel bar Khattāb, to whom Assemani has devoted two articles in the *B O*, ii, at pp 244 and 463. Among the poems of Bar Hebraeus we find verses addressed to this Daniel by the Nestorian Khamis bar Kardūh with his reply and another by Bar Hebraeus.⁸ He composed abridgements in Arabic of several of Bar Hebraeus's works, e.g., the *Nomocanon*,⁹ *Ellices*, *Aṣṣar Rāzē*, *Mēnārāth Kudhshē*, *Kethābhā dhē Bhābhāthā*, and the larger grammar.¹⁰ An independent work of his, also in Arabic, treats of *The Bases, or First Principles of the Faith and Consolation of the Hearts of Believers*.¹¹

With Daniel bar Khattāb we may close our list of Jacobite writers in the literature of Syria. The Nestorians kept the lamp burning for a little, though not much longer, as we shall presently see.

Solomon
of al
Basrah Shūlūmōn, or Solomon, of Khilūt or Akhlūt, on the shores of Lake Van, was present as metropolitan of Pmrth dē Maršān or al Basrah at the consecration of the catholicos Sabhr ishō' in 1222.¹² Besides some prayers and short discourses (*māmūnā*), he wrote a treatise on the figure of the heavens and the earth,¹³ and compiled a volume of analecta, partly theological, partly historical, which he entitled *Kethābhā dhē Dhrbūrthā* or "the Bee." It is dedicated to his friend Narsai, bishop of Khōnī Shāblikōr or Bēth Wārik, called by the Arabs al Bawūzī or al Bawūzī,¹⁴ on the lesser Zūb. Of this work an analysis has been given by Assemani in the *B O*, iii 1, 309-324, and there is a German translation of it by Schönfelder, 1866. It has been recently edited by Mr E. A. W. Budge, of the British Museum, with an English translation, Oxford, 1886.¹⁵

George
Wardā. This was an age of song with the Nestorians, in which lived some of their favourite writers of hymns. (1) One of the most conspicuous of these is George Wardā (the Rose) of Arbēl or Irbil, whose poems have entered so largely into the use of the Nestorian Church that one of their service books is to this day called the *Wardā*.¹⁶ His date may be gathered from certain of his hymns, which speak of the calamities of the years 1535-38=1224-27 A.D.¹⁷ (2) About the same time flourished Mas'ūd of the family Bēth Kashishā (in Arabic Ibn al Kass), who was physician (*hakīm*) to the caliph al Mustas'im (1242-58), and outlived his patron.¹⁸ One of his poems

for the feast of the Epiphany occurs in Cod Vat. clxxxiv (*Catal* iii p 389).¹⁹ (3) Khamis bar Kardūh of Arbēl was a younger contemporary of Bar Hebraeus, as appears from his correspondence *Khamis* with Daniel bar Khattāb (see above). He too has bequeathed his name to one of the Nestorian service books, which is still called Gabriel the *Khamis*.²⁰ (4) Gabriel Kanāsi (the Loenst) was a monk of Bēth Kamsī Kūkā. He became metropolitan of Mosul, and was present at the consecration of Yabīh alāhā III in 1281.²¹ There is a long poem of his in Cod Vat. clxxx (*Catal*, iii 376), treating of the creation, the incarnation, the life of our Saviour, the preaching of the apostles, and the praises of the fathers of the church, and concluding with an encomium on Sabhr ishō', the founder of Bēth Kūkā. (5) John John of Mosul was a monk of the convent of St Michael near that city. His work entitled *Kethābhā dhē Shappir Dubbār* was published at Rome in 1868 by E. J. Millos, archbishop of Akri, as a school book, under the title of *Directorium Spirituale*. It is, of course, impossible to say to what extent the original has been tampered with in such an edition, but there is a MS in the Brit. Mus. Or 2450.²² The composition of the work is placed by Millos in 1245, and the death of the author by Cardūn (*Lab. Theol.* p 120) in 1270.

'Abhd ishō' bar Bērkhā holds nearly the same position in regard to the Nestorian Church that Bar Hebraeus does in relation to the Ishō bar Jacobite, though far inferior in talent and learning to "the Son of Bērkhā, the Hebrew." He flourished under Yabīh alāhā III, being firstly bishop of Shuggār (Sinjar) and Bēth 'Arbīyē about 1285,²³ and afterwards, before 1291, metropolitan of Nisibis and Armenia. He died in 1318.²⁴ He has left us a list of his own publications at the end of the *Catalogus Librorum*, in the *B O*, iii 1, 325 sq. Several of these seem to be lost,—at least they do not appear in the catalogues of our collections,—such as the commentary on the Old and New Testaments,²⁵ the *Kethābhā Katholikos* on the marvellous dispensation or life of our Lord on earth,²⁶ the *Kethābhā Skolasit* against all the heresies,²⁷ the book of the mysteries of the Greek philosophers,²⁸ the twelve discourses comprising all the sciences,²⁹ and the ecclesiastical decisions and canons,³⁰ as also an Arabic work with the title *Shah marwārd* or "the king pearl."³¹ The *Man gānithā* or "Pearl" is a theological work in five sections, treating of God, the creation, the Christian dispensation, the sacraments of the church, and the things that prefigure the world to come. There is a careful analysis of its contents in *B O*, iii 1, 352-360. It has been edited, with a Latin translation, in Mai, *Scriptt. Vett. Nova Coll.*, x, and done into English by Badger, *The Nestorians*, ii 350 sq. The date of composition is 1298.³² 'Abhd ishō' himself translated this work into Arabic in 1312, as we learn from 'Amr ibn Mattā in the *Maydal*, where large portions of it are quoted.³³ The *Collection of Synodical Canons or Nomocanon* is also fully analysed by Assemani, *B O*, iii 1, 332-351. It has been edited, with a Latin translation, in Mai, *Scriptt. Vett. Nova Coll.*, x. As a poet 'Abhd ishō' does not shine according to our ideas, although his countrymen admire his verses greatly. Not only is he obscure in vocabulary and style, but he has adopted and even exaggerated all the worst faults of Arabic writers of rime prose and scribblers of verse.³⁴ His principal effort in poetry is the *Paradise of Eden*, a collection of fifty poems on theological subjects, which has been analysed by Assemani, *B O*, iii 1, 325-332.³⁵ This volume was published by the author in 1291, and in 1316 he found that it was necessary to add an explanatory commentary.³⁶ Another collection of twenty-two poems, which may be regarded as parts of one composition, treating of the love of wisdom and knowledge, is found in Cod Vat. clxxx (*Catal*, iii 359) and Bodl. Marsh 201 (P Smith, *Catal*, p 510), and a third, including the above and a selection from the *Paradise*, is contained in Bodl. Marsh, 361.³⁷ Of his minor works, enumerated in the *B O*, iii 1, 361, the consolatory discourses, the letters, and the commentary on the epistle of Aristotle to Alexander concerning the great art (alchemy) seem

¹ *B O*, ii 264.

² Edited by Pocock, with a Latin translation, in 1663. MSS.—Cod Vat. clxvii, Brit. Mus. Add 6944, 6952, 1, 23304-5. Bodl. Pocock 54, 162, Palat. Medic. cvvii.

fonds 104, there is a poem explanatory of the ecclesiastical calendar (Jostenberg, *Catal*, p 123).

to be lost. The *turgām* are collected in a MS at Berlin, Alter Bestand 41, 4. His commentary on an enigmatical poem of Simeon Shangkēlāwī we have already mentioned (see above, p. 852). To us his most useful work decidedly is the *Catalogue of Books*, which forms the basis of vol. iii. part 1 of Assemani's *Bibl. Orient.* There is an older edition of it by Abraham Ecchellensis, Rome, 1653. It has been translated into English by Badger.¹ The *Catalogue* consists of four parts, viz., (1) the Scriptures of the Old Testament, with sundry apocrypha *B O*, iii. 1, 5, (2) the Scriptures of the New Testament, p. 8, (3) the Greek fathers who were translated into Syriac, p. 13, (4) the Syriac fathers, chiefly, of course, of the Nestorian Church, pp. 65-362. It is to be regretted that Ablid ishō contented himself merely with enumerating the titles of

¹ *The Nestorians*, ii. 361. Badger ascribes the work to the year 1208, probably on the authority of his MS.

books, and never thought it worth his while to give the date of the writers, nor even to arrange his notices in any kind of chronological order.²

After Ablid ishō there are hardly any names among the Nestorians worthy of a place in the literary history of the Syrian nation. We may make an exception in favour of the catholicos Timothy II, who was elected in succession to Yabī alāhā III in Timothy 1318, having previously been metropolitan of Mosul and Irbil II under the name of Joseph.³ He wrote a work on the sacraments of the church of which Assemani has given an analysis in *E O*, iii. 1, 372-380.⁴ His death took place in 1328. (W. W.)

³ *B O*, iii. 1, 567. ⁴ Vat. cl.

SYZRAŃ, a district town of Russia, in the government of Simbirsk, lies 90 miles to the south of Simbirsk, a few miles from the Volga. It originated in a fort, erected in 1683, to protect the district from Tatars and Circassians. Most of its inhabitants (24,500 in 1882) are engaged in gardening and tillage. In the large villages of the surrounding district, one of the richest in Simbirsk, various petty trades are carried on. SyzraŃ has long been in repute for its tanneries and manufactures of leather (£20,000 annually). Several flour-mills and other manufactures have recently sprung up. The town is connected by rail with Penza and Morshansk in the west, and with Orenburg in the east, and much grain is exported, timber is brought from the upper Volga, and manufactured wares from Nijni-Novgorod. In 1882 the goods shipped from SyzraŃ and Batrakī (a port on the Volga) were valued at £153,540. In the same year the grain and other wares sent by rail exceeded one million cwts. SyzraŃ is a badly built town, most of the houses being of wood.

SZABADKA (German, *Maria-Theresenopol*), a royal free town of Hungary, in the county of Bács, on Lake Palics, in 46° 8' N lat and 19° 42' E. long. It is the centre of an immense agricultural district and has little claim to special distinction. There are a chamber of advocates, an upper gymnasium, a state training institute for governesses, and an industrial and commercial school. The population (61,367 in 1880) was about 63,500 in 1885, mostly Hungarians, but partly Bunyevács (a branch of Servians).

SZARVAS, a town of Hungary, on the Körös, in the county of Békés, is a place noted for the wealth of its peasantry and the excellence of its breed of horses. The population was 22,504 in 1890, and about 24,000 in 1885, chiefly Slovaks, but all speaking Hungarian.

SZATMAR-NÉMETI, a royal free town of Hungary, in the county of Szatmár, is situated on the river Szamos and the Hungarian North-Eastern Railway, in 47° 49' N lat and 22° 51' E. long. It is the seat of a Roman Catholic bishop and has a seminary, a male and female normal school, and several Government offices. The town has a considerable trade in wine and wood. The population numbered 19,708 in 1880, and about 22,000 in 1885. They are mostly Magyars, and by religion Romanists, Protestants, and Greeks in almost equal proportions.

SZEGEDIN, a royal free city of Hungary, second only to Budapest, is situated on both banks of the Theiss at the influx of the Maros, in 46° 16' N lat and 20° 10' E long, in the county of Csongrád. It is a great centre of the commerce and agriculture of the Alföld, has a Roman

Catholic gymnasium, a state real school, and a library with about 80,000 volumes. There are a Franciscan, a Piarist, and a Minorite convent, and a large hospital, as well as various Government offices, a superior law court, and a chamber of advocates. The inner town consists of fine broad streets and large squares adorned with many palatial edifices, but the suburbs, inhabited by the peasantry, are little superior to ordinary Hungarian villages. The river is spanned by a railway bridge of stone and a fine suspension bridge. Szegedin possesses factories of soap, soda, matches, candles, leather, and spirits, steam and saw mills, and salt and tobacco magazines. It is the chief seat of the manufacture of *paprika* (a kind of pepsicum) and of a pastry *tarhonya*, both largely exported to all parts of the world. During the summer the shipping trade is very brisk, especially in corn and timber. Szegedin is an important station on the Alföld-Flume and the Austrian-Hungarian State Railways, and is a terminus of the Arad-Csanád Railway. The inhabitants in 1880 numbered 73,675, and in 1885 76,600 (estimated), entirely Magyars.

Since the 15th century Szegedin has been one of the most prominent cities in Hungary. From 1520 till 1686 it was in possession of the Turks, who fortified it. It is also notorious for its many witchcraft trials. In 1818 it sent strong detachments to the national Hungarian army. In July 1849 the seat of the Government was transferred hither for a short time. In March 1879 the town was almost completely destroyed by an inundation. In the reconstruction the site of the old fortress was laid out as a public garden.

SZENTES, a market town of Hungary, in the county of Csongrád, on the left bank of the Theiss, 30 miles north of Szegedin. It has a county-hall (1885) and a promenade. The inhabitants are chiefly employed in agriculture, in breeding geese, and in fishing. The population (28,712 in 1880) numbered about 30,000 in 1885, all Magyars.

SZIGET (*Mármaros-Siget*), chief town of the county of Mármaros in the north-east of Hungary, is the centre of a salt-mining district, with mining and forestry head departments. The town lies in a valley which abounds in picturesque scenery and is rich in mineral springs. It has a county-hall, Protestant and Catholic gymnasias, a convent, a nunnery, and a training school for teachers. The population (10,852 in 1880) was about 11,200 in 1885.

SZOLNOK, the capital of the county of Jász-Nagykun-Szolnok, Hungary, is situated on the Theiss and the Zagyva, and is the junction of four railways. It carries on a brisk trade in tobacco, salt, and especially in wood. In 1880 the population (Magyars), chiefly Roman Catholics, numbered 18,247, and in 1885 about 19,000.
